Code Horizons

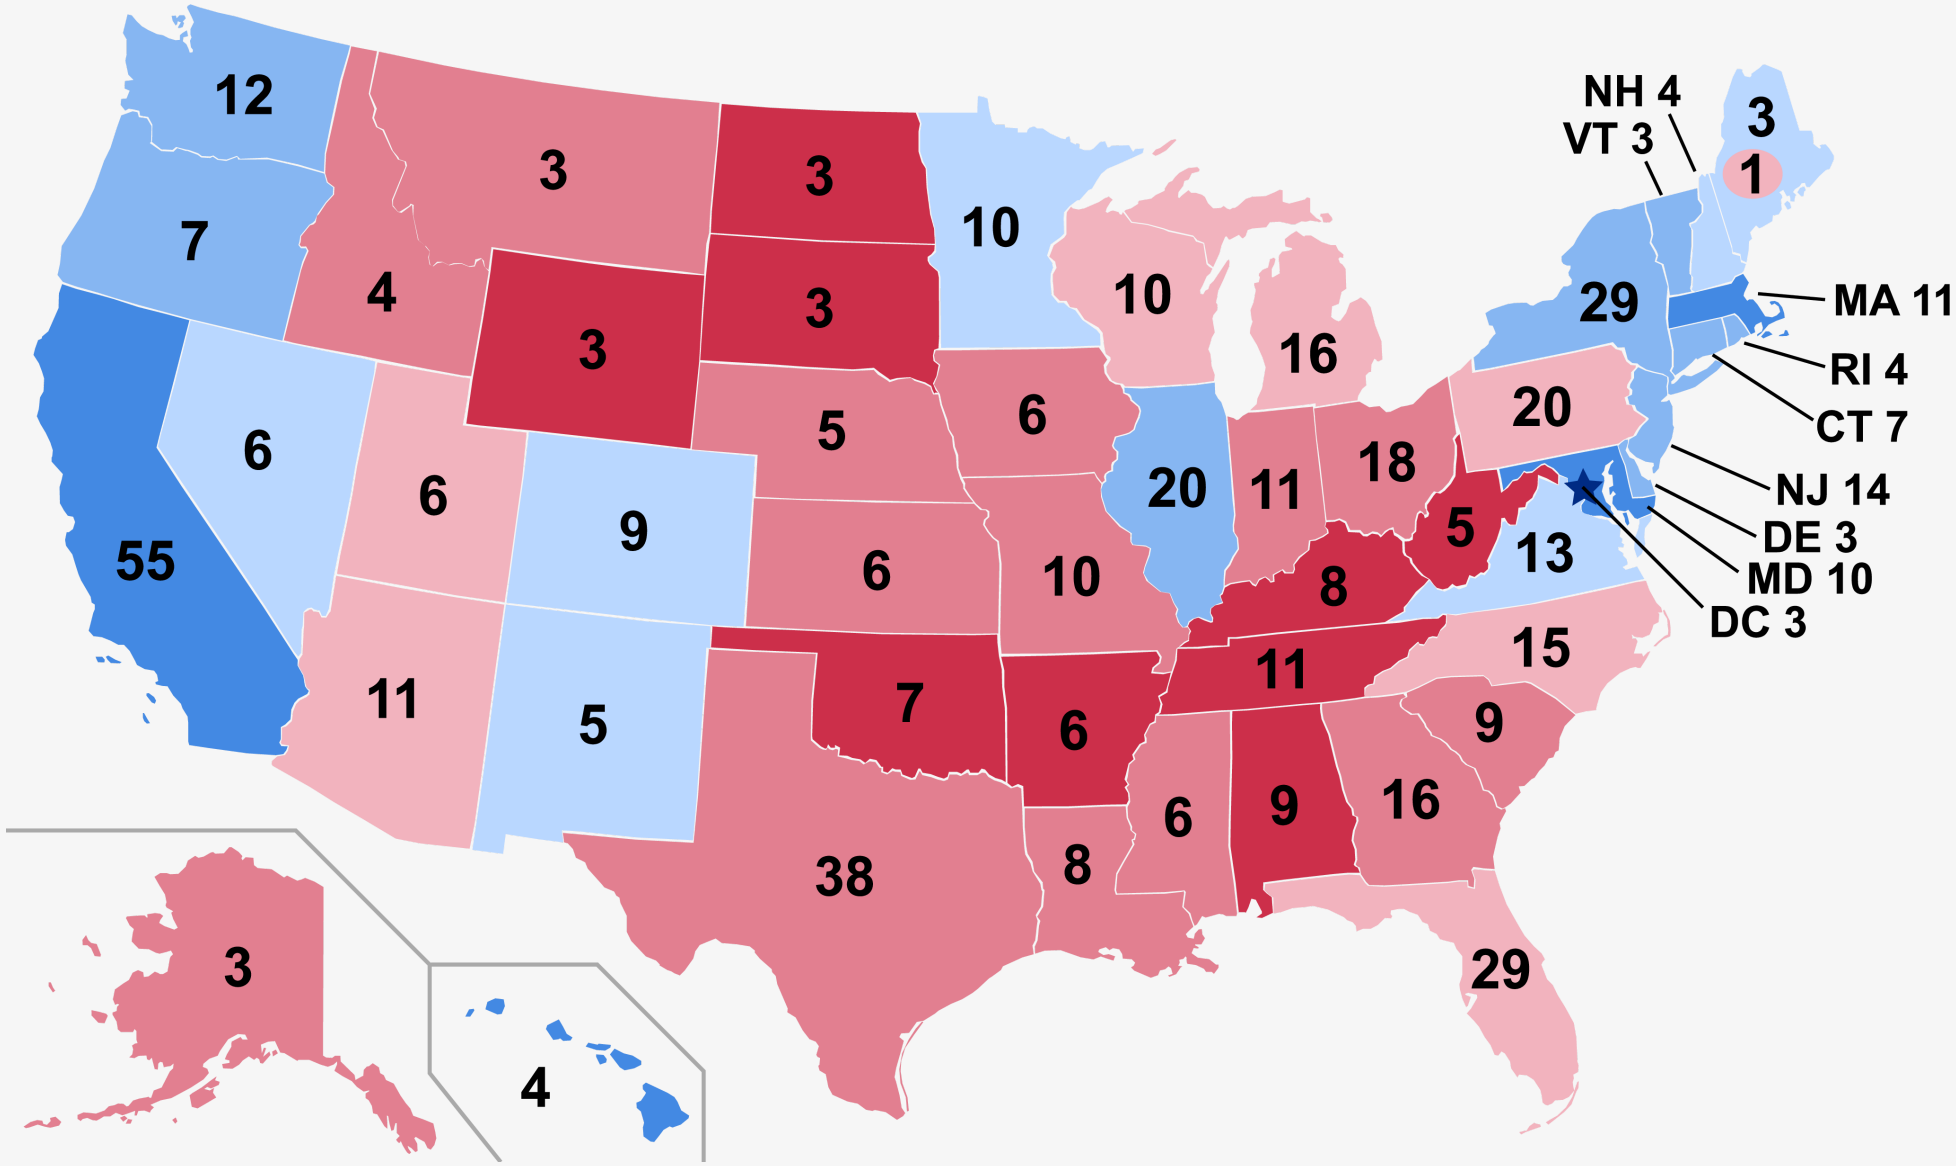
December 10, 2023

Making Maps

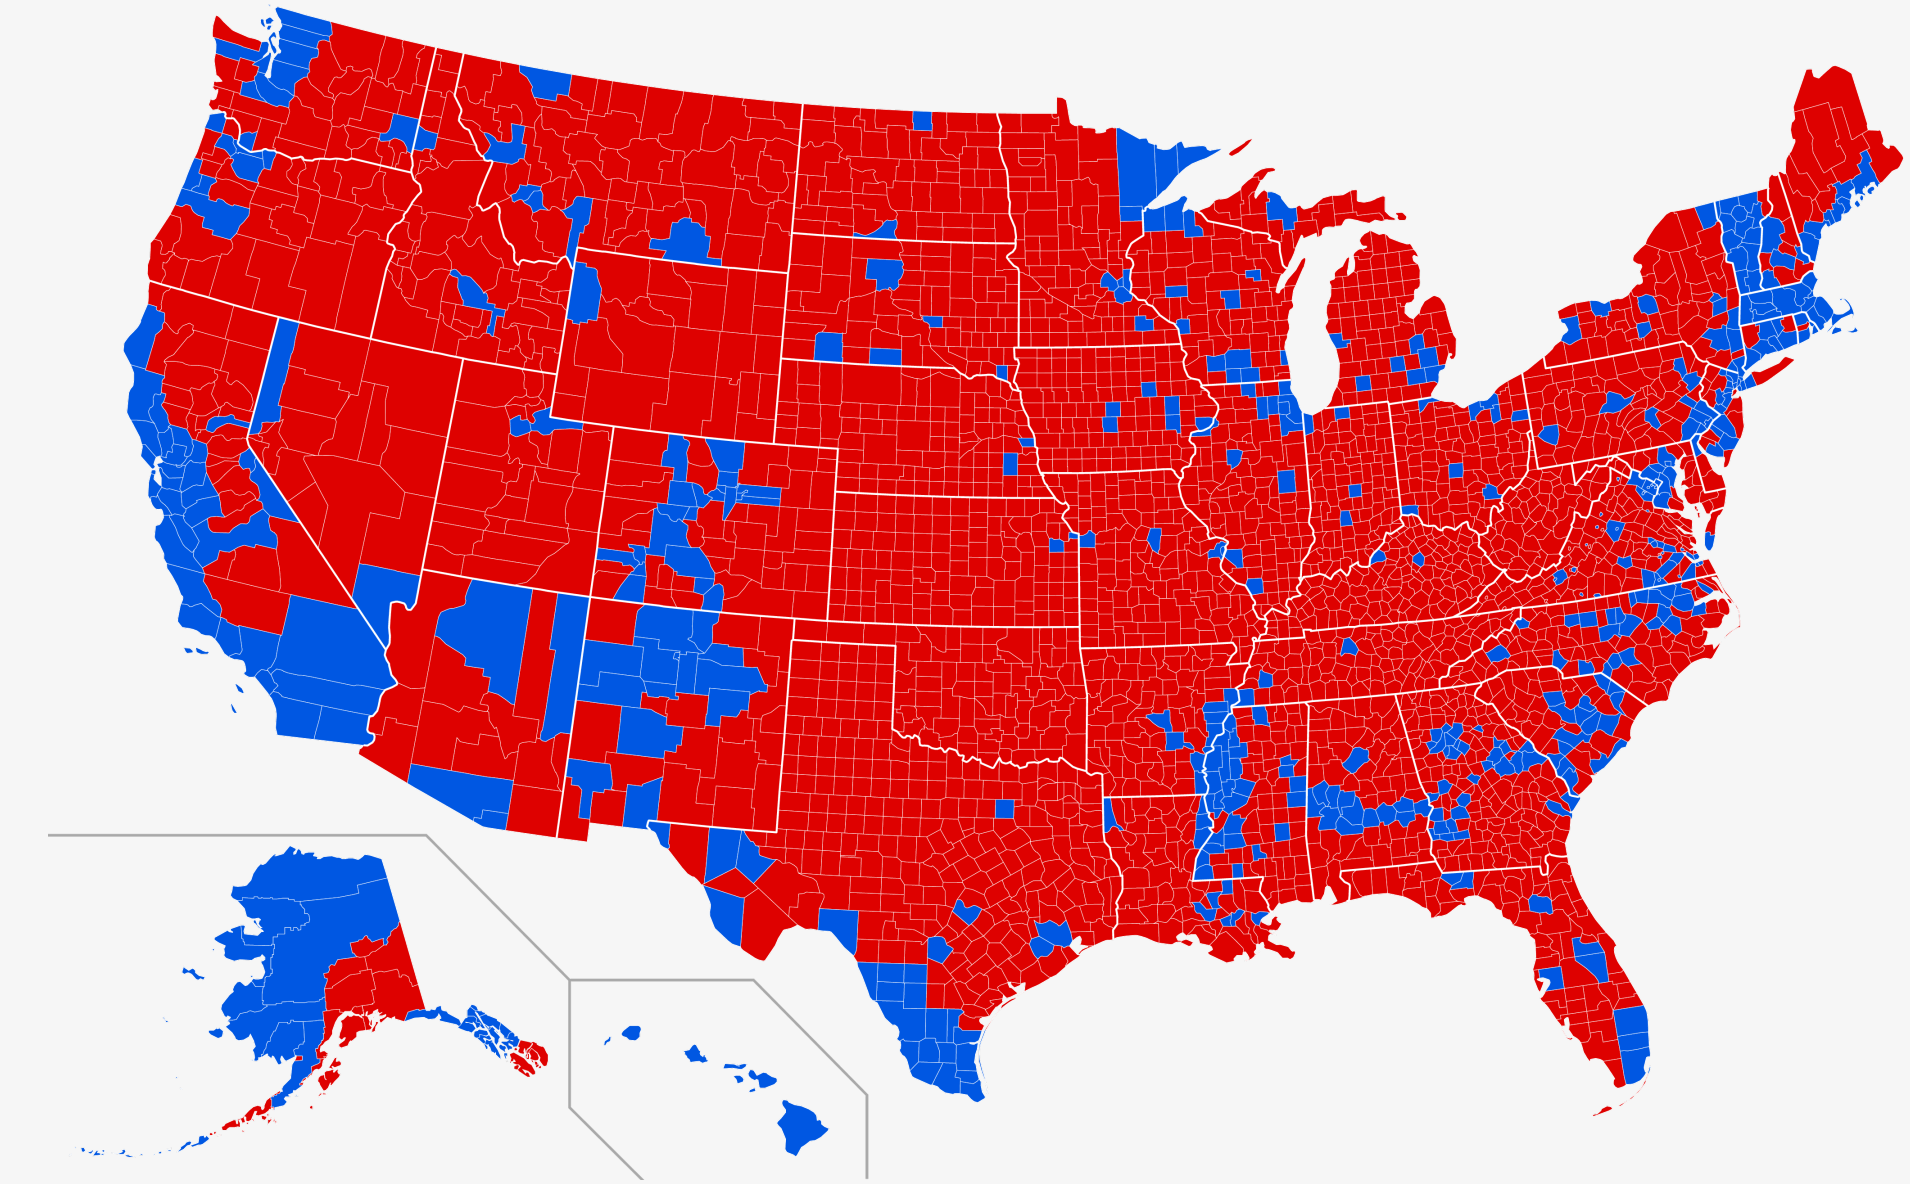
Load our packages

```
library(here)      # manage file paths
library(socviz)    # data and some useful functions
library(tidyverse) # your friend and mine
library(maps)      # Some basic maps
library(sf)        # Simple Features Geometries and geom_sf()
library(ggforce)   # Useful enhancements to ggplot
```

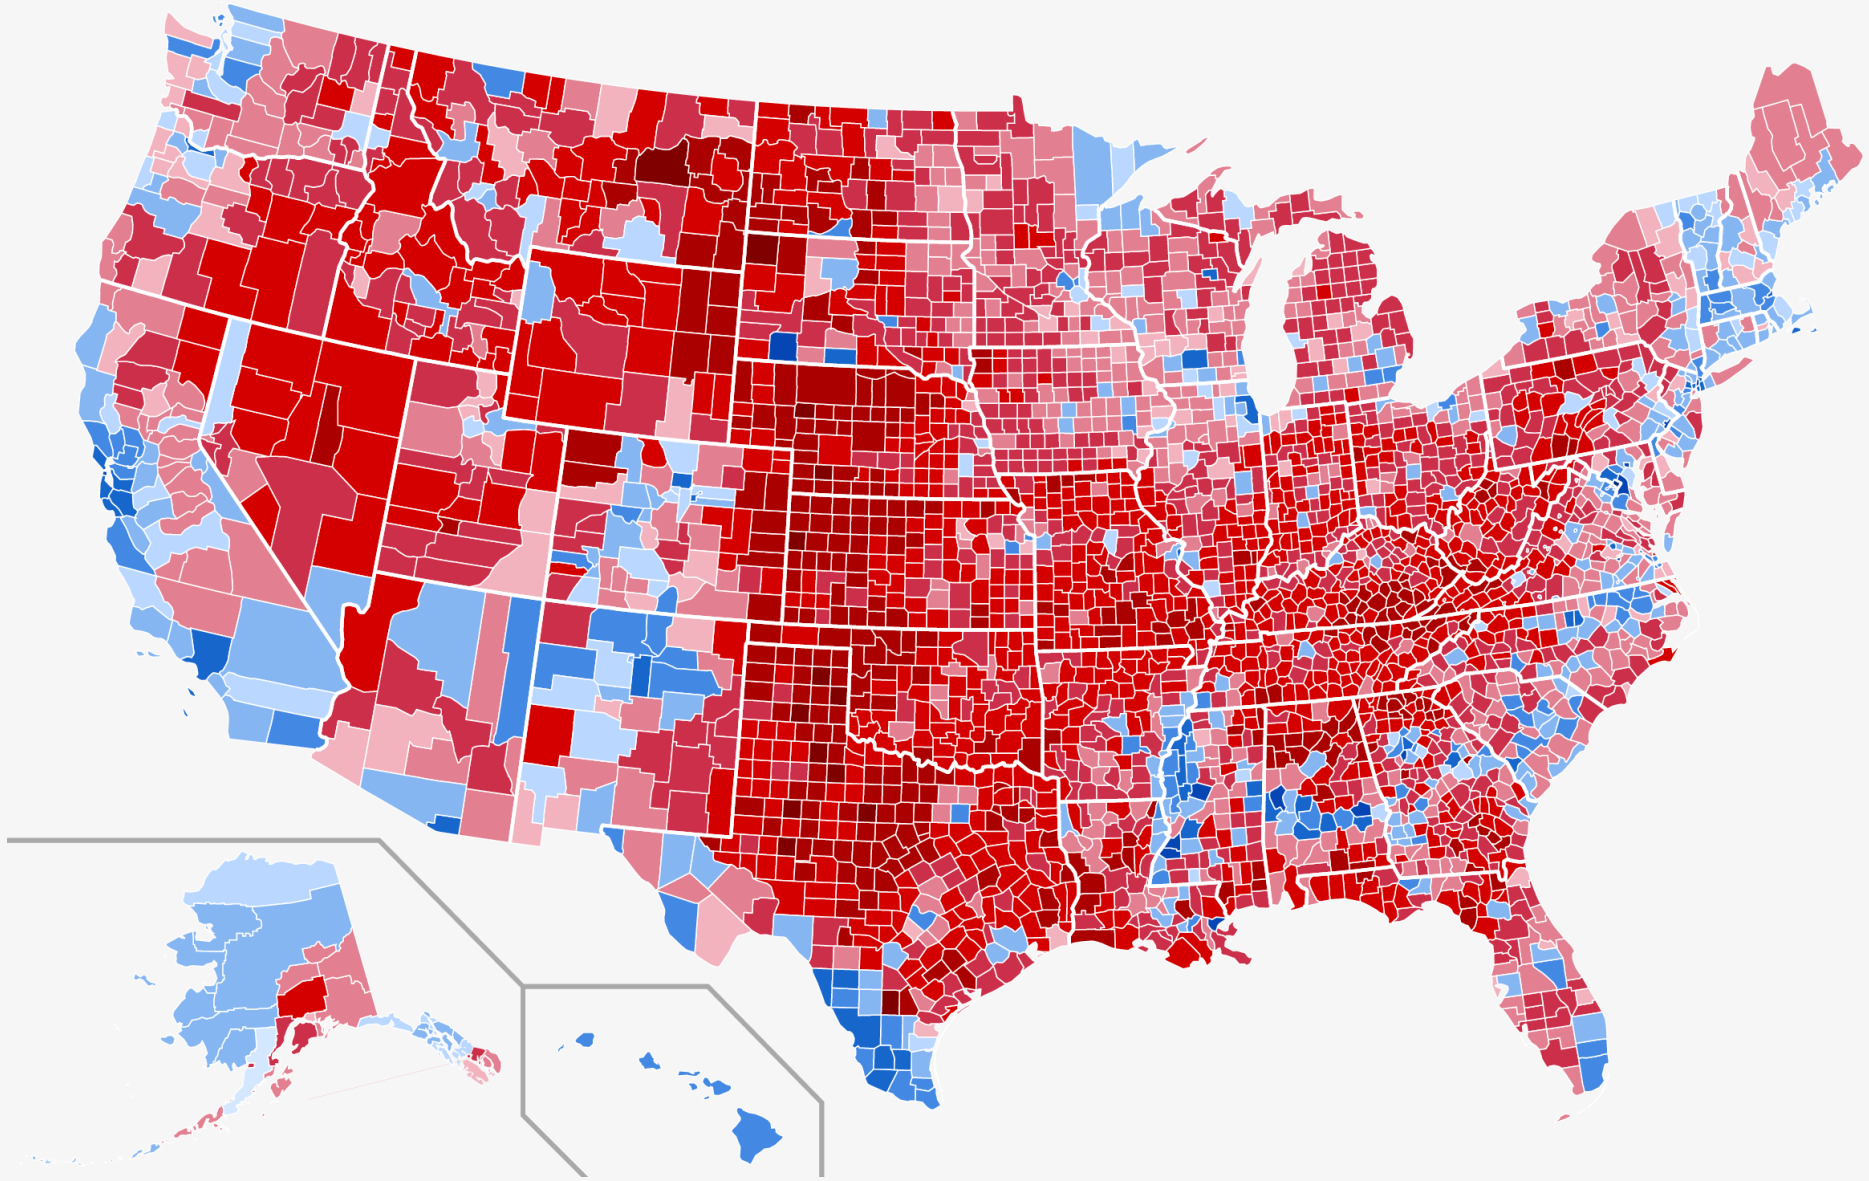
Choropleths



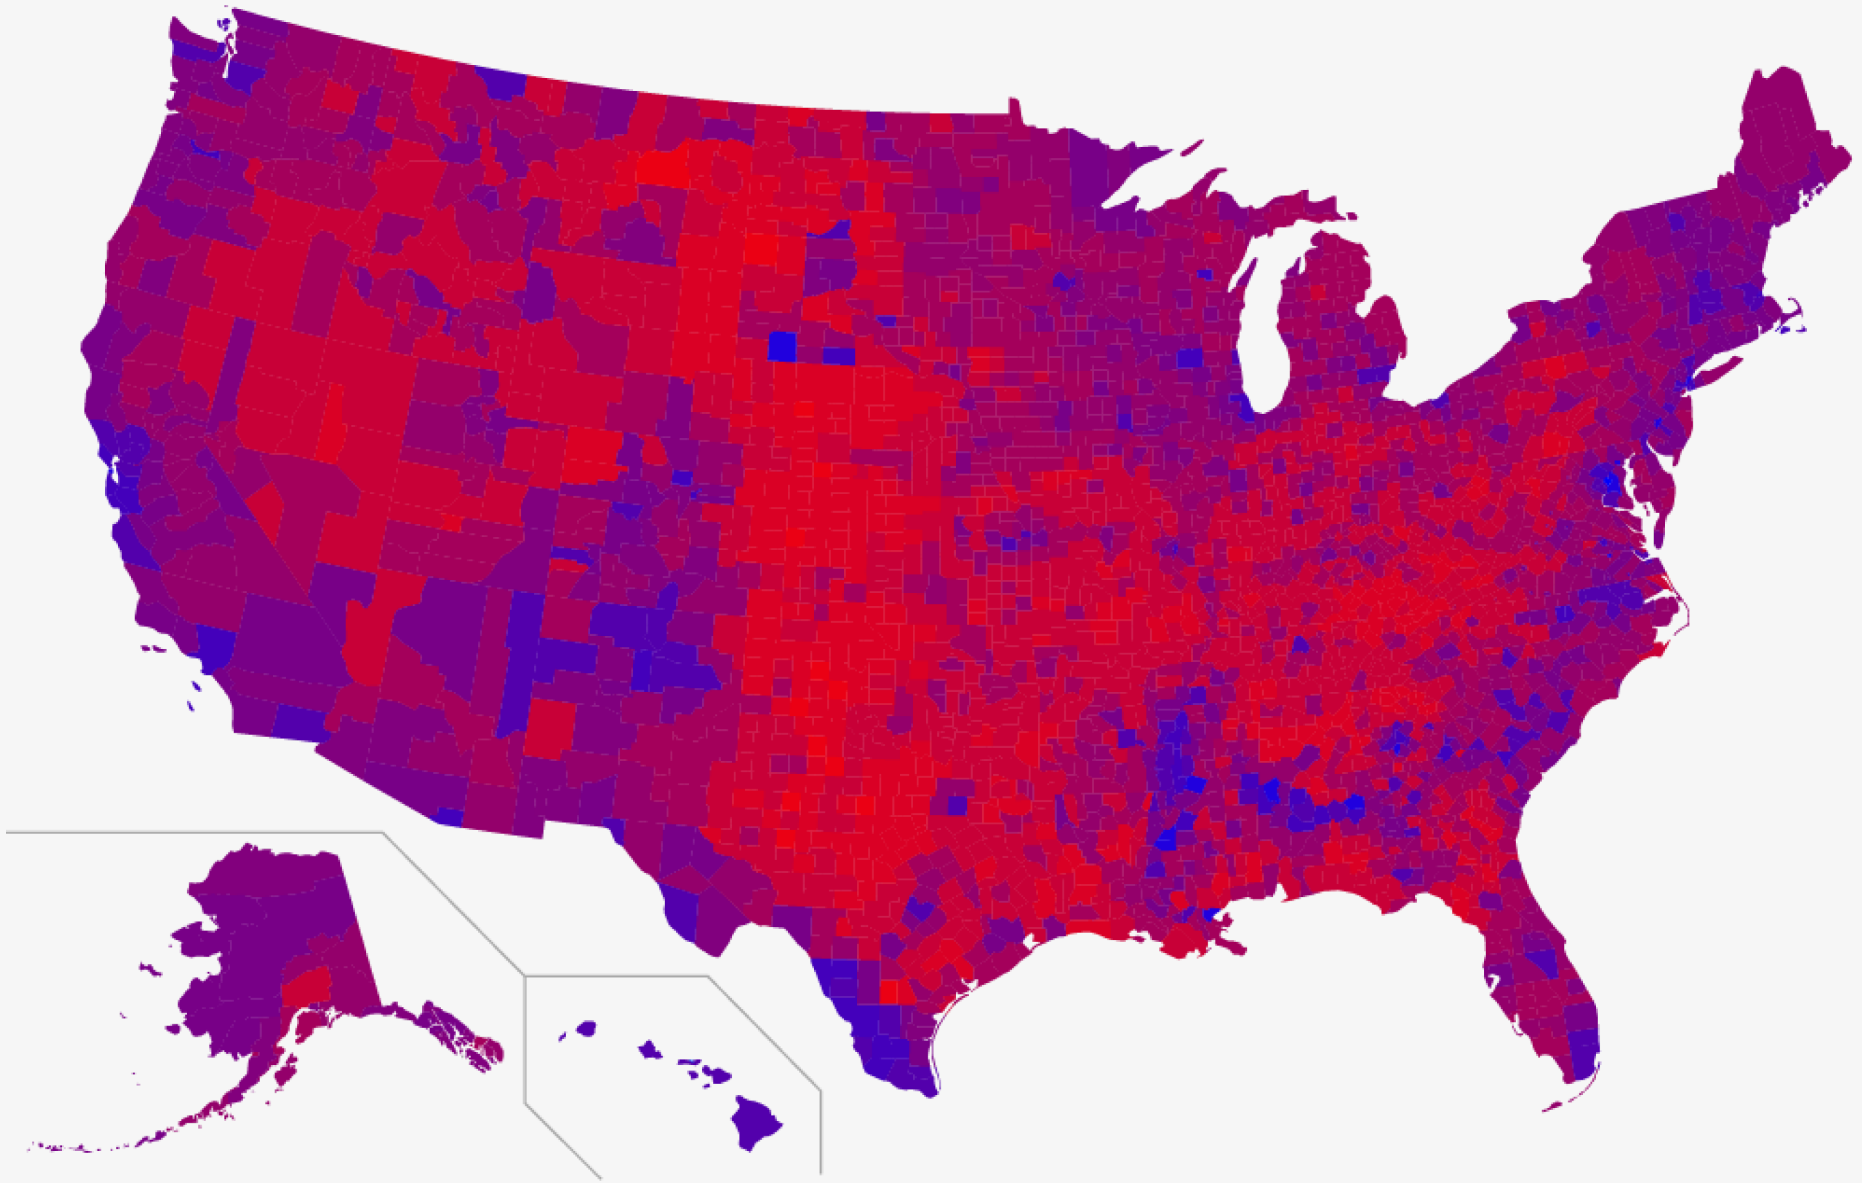
State-level; vote share; diverging; binned into four categories.



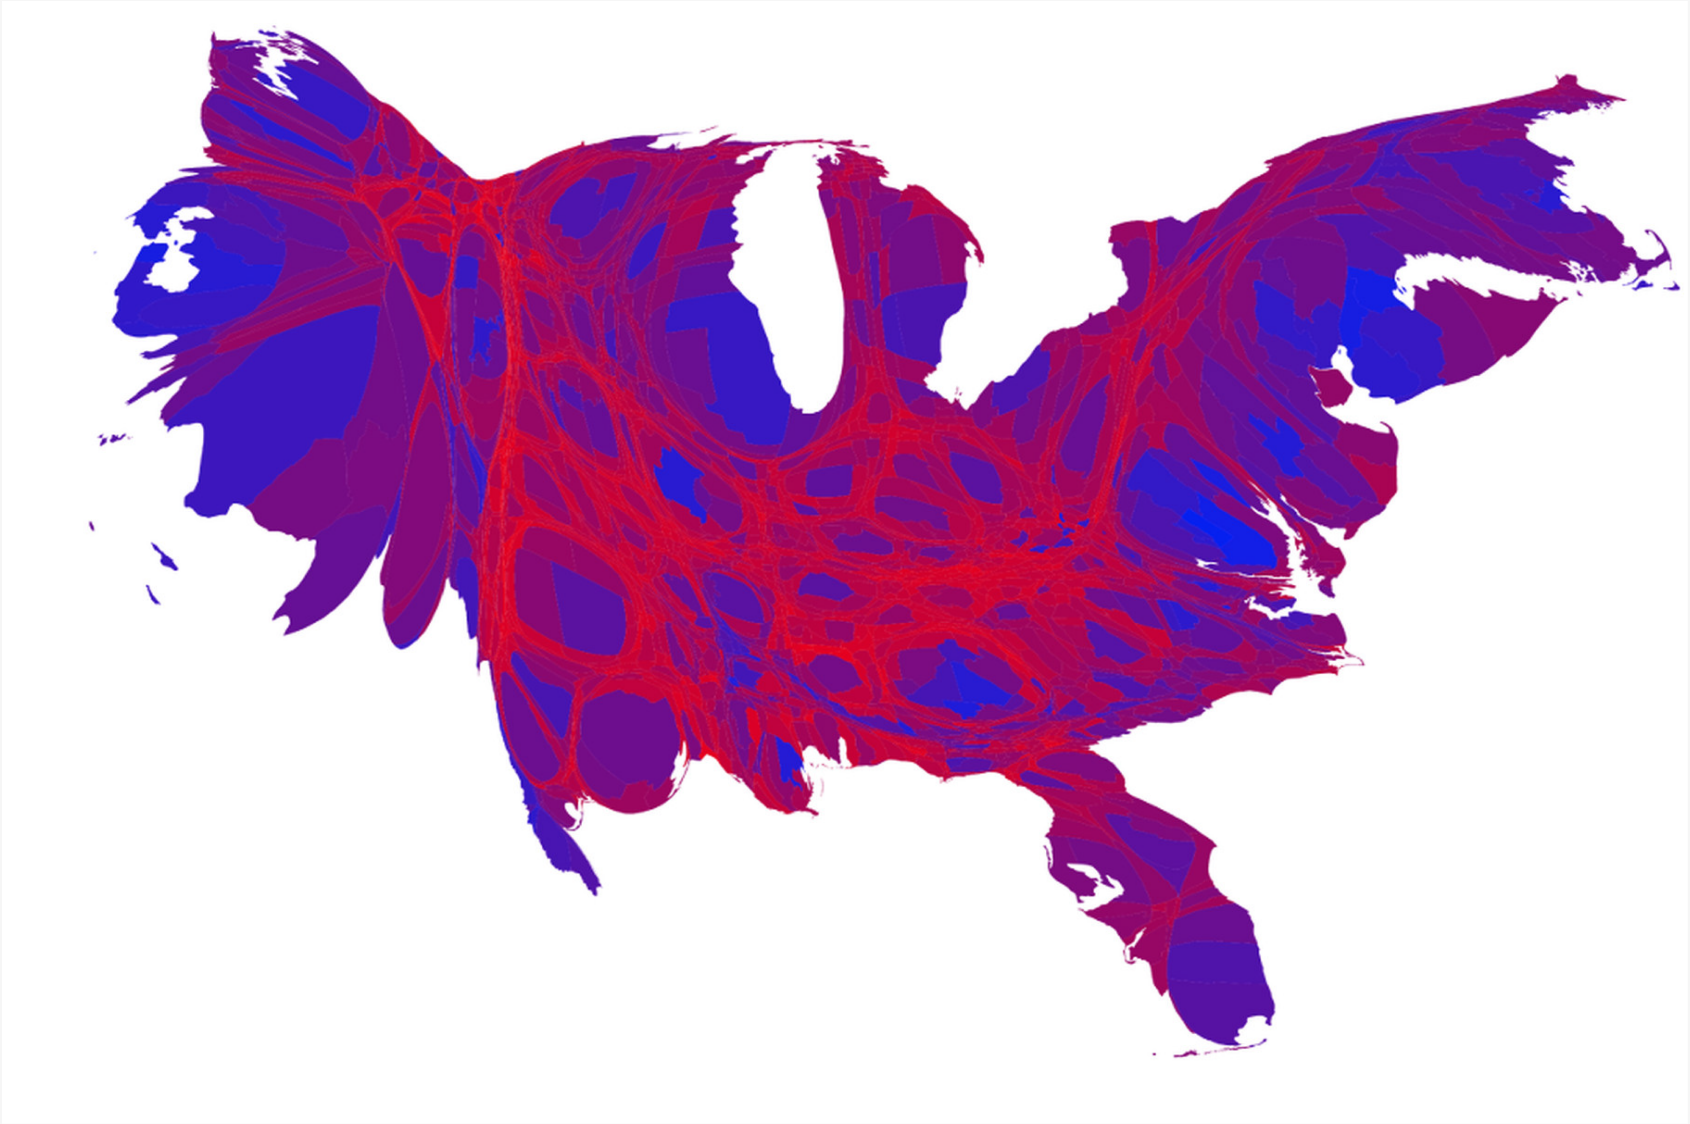
County level; winner only



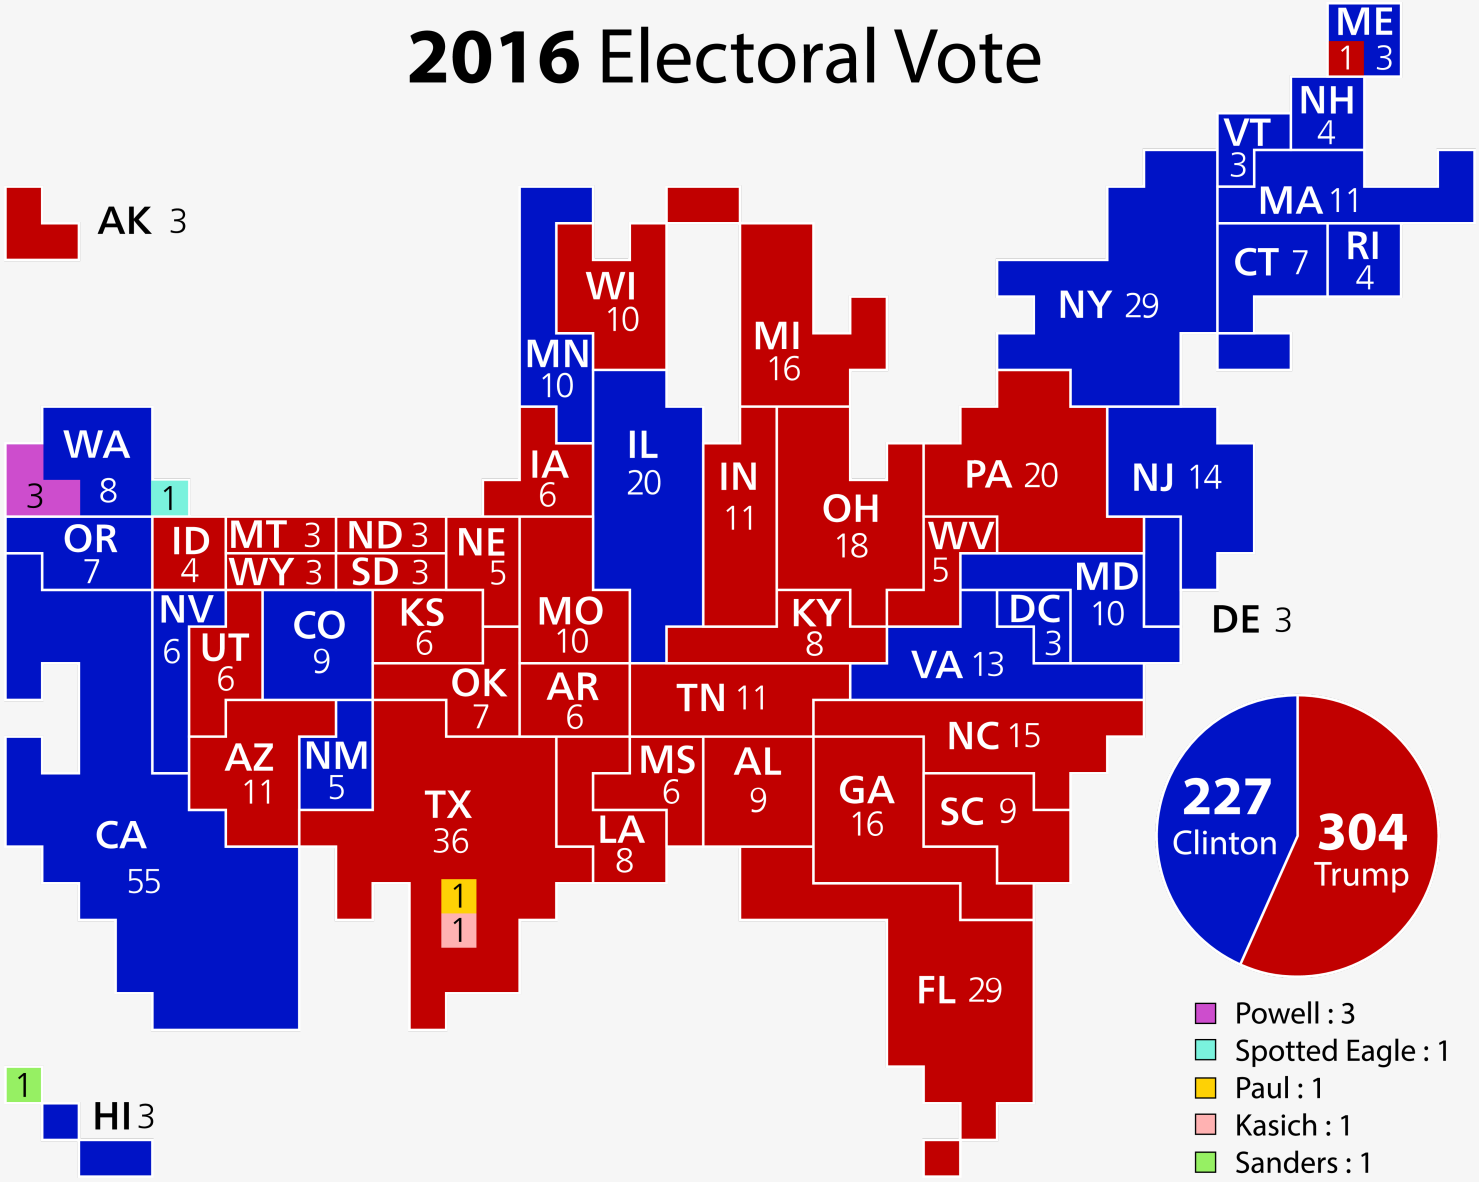
County level vote share; diverging; binned into six categories



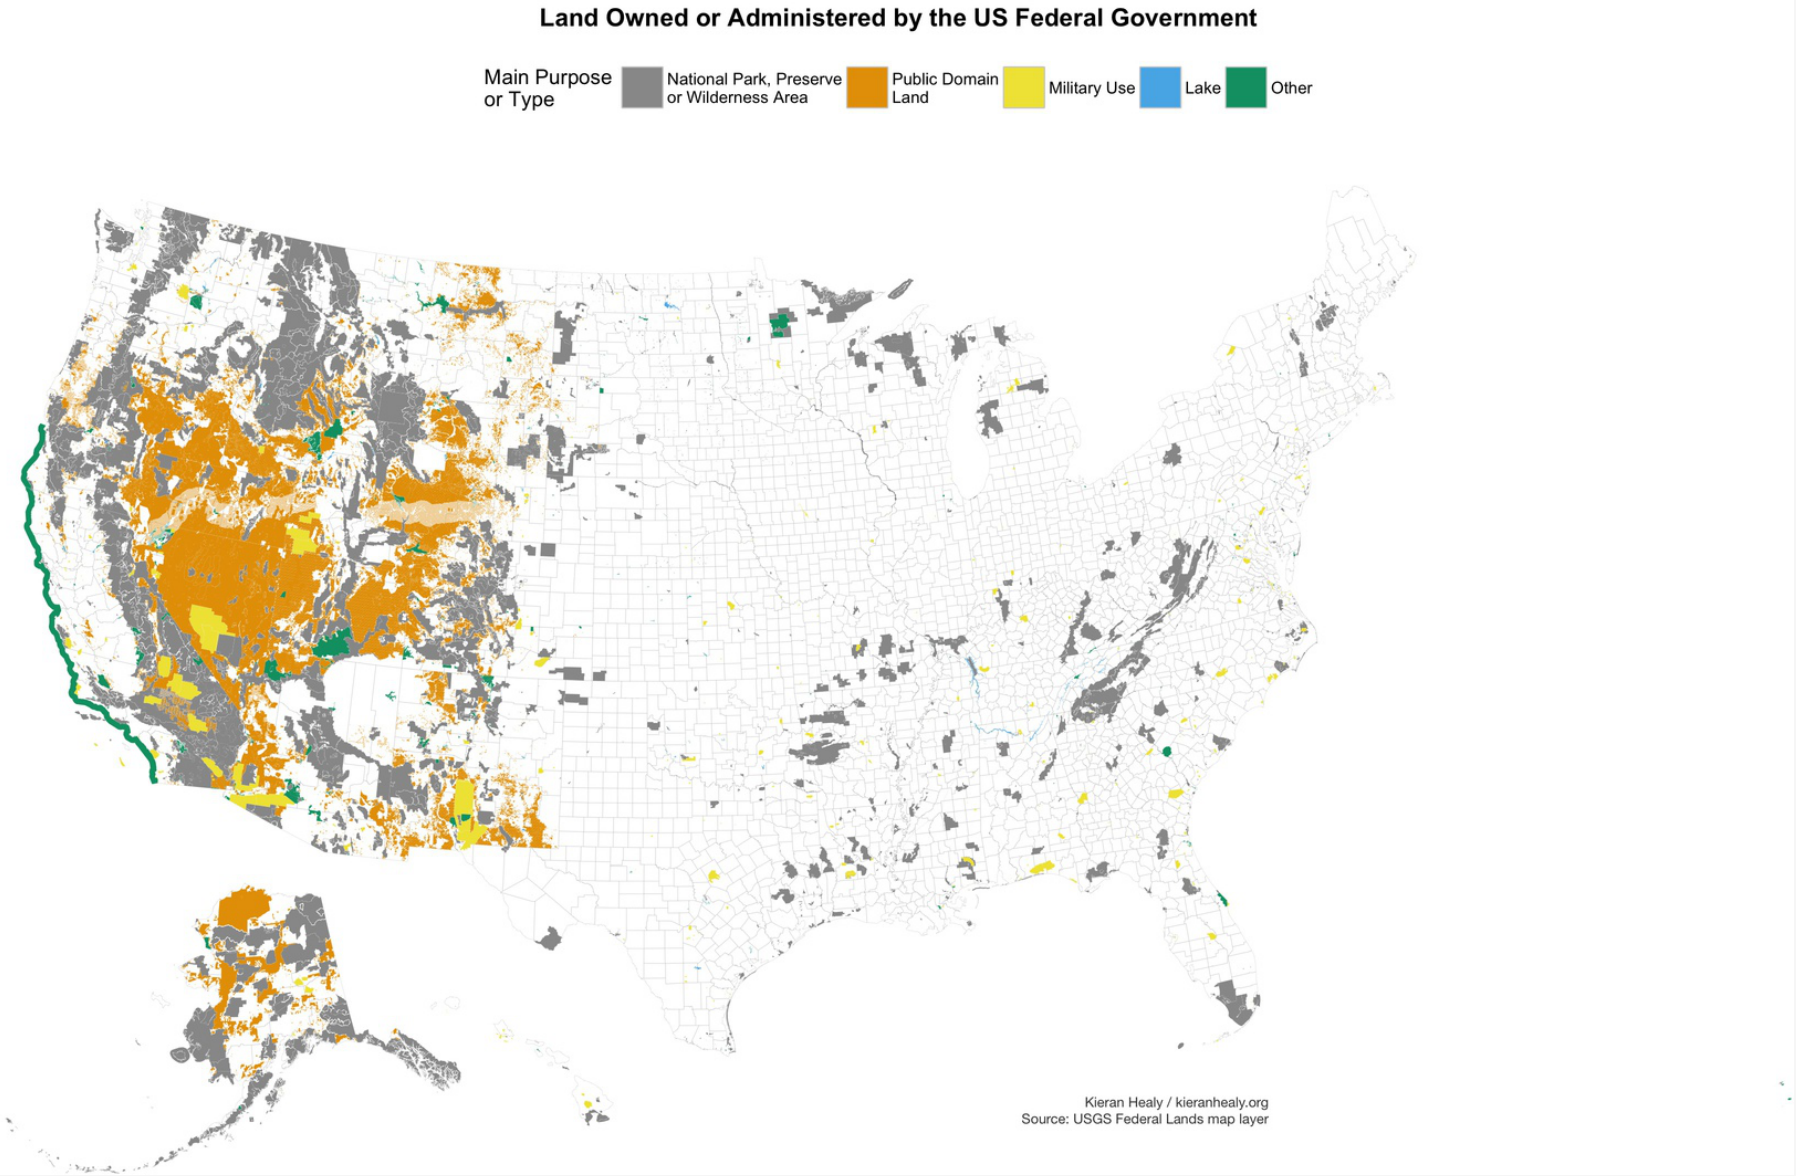
County level vote share; diverging continuous; purple midpoint



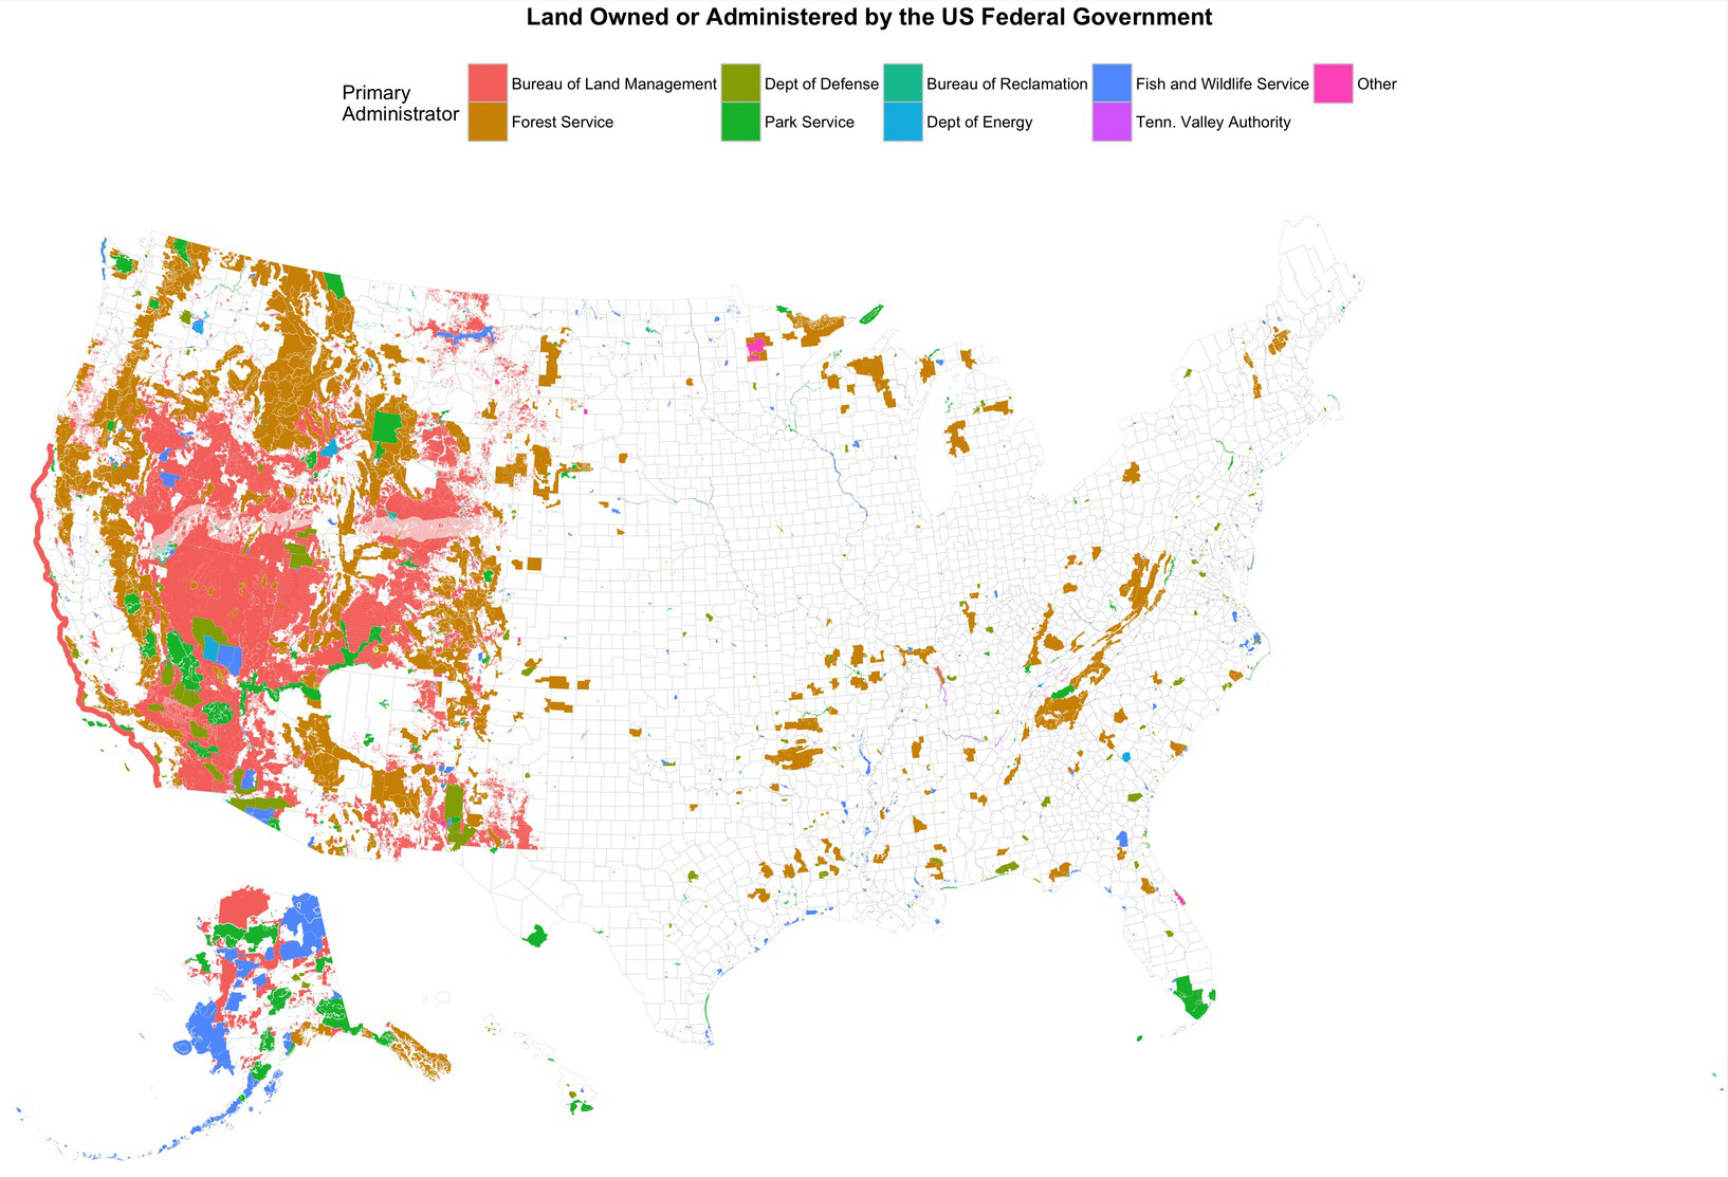
County level vote share; purple midpoint; county area deformed in proportion to population. By Mark Newman



Electoral college cartogram (NYT)

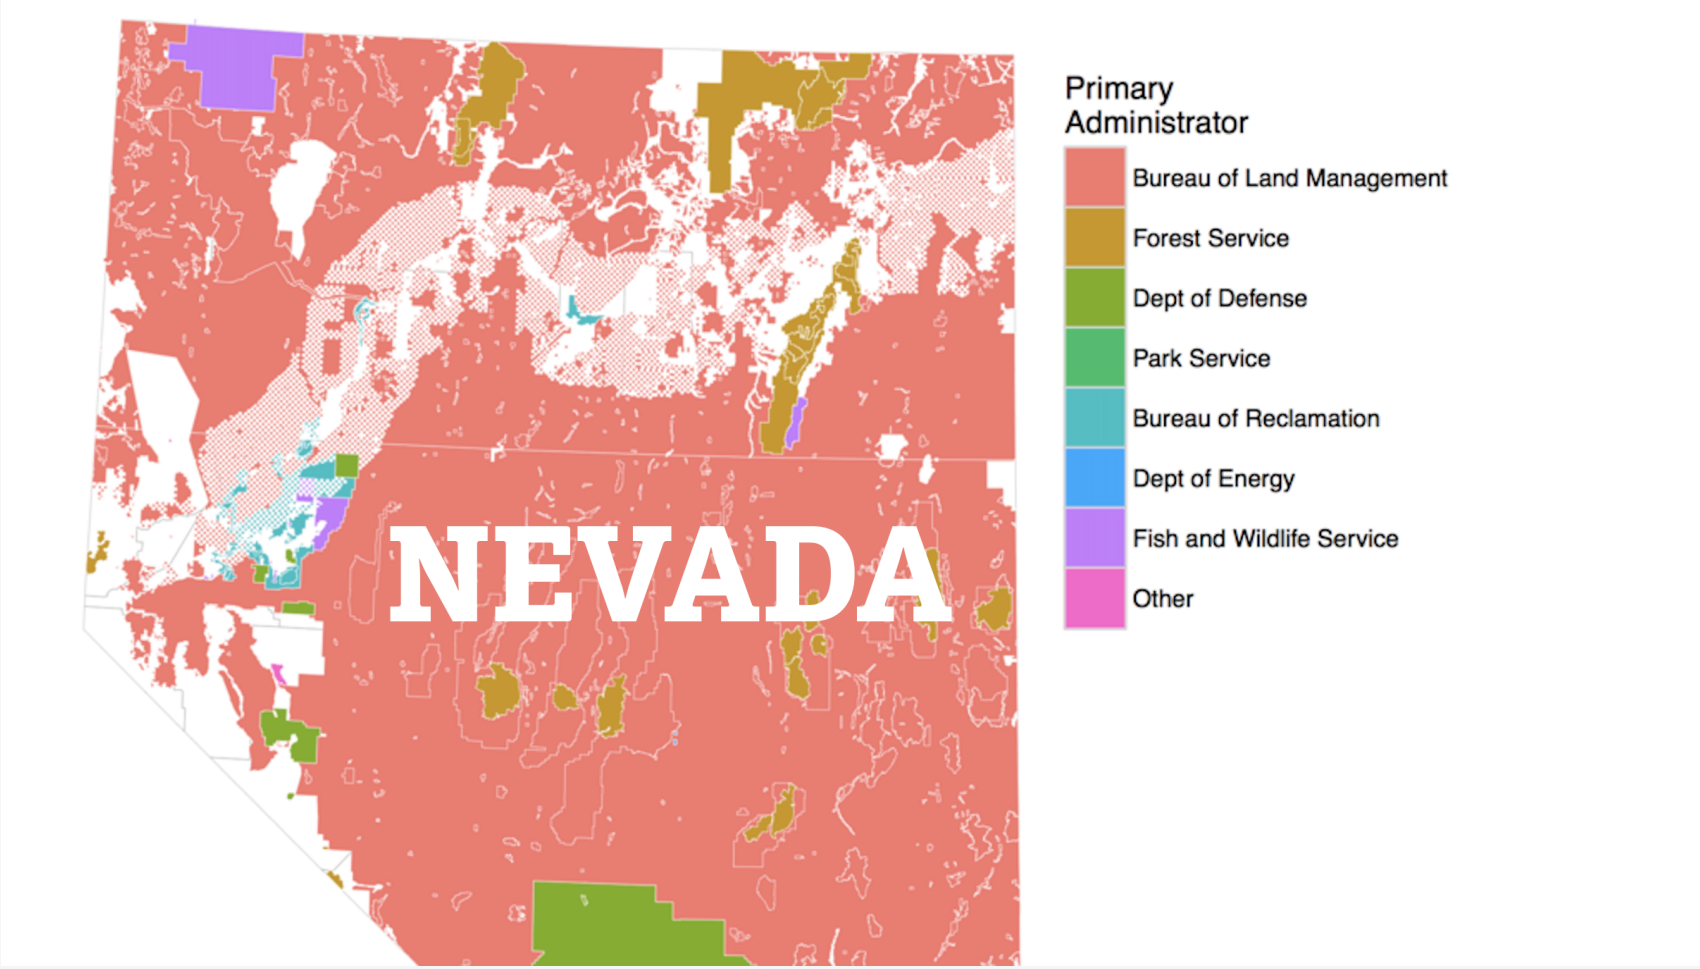


Pretty, Big, and Pretty Empty

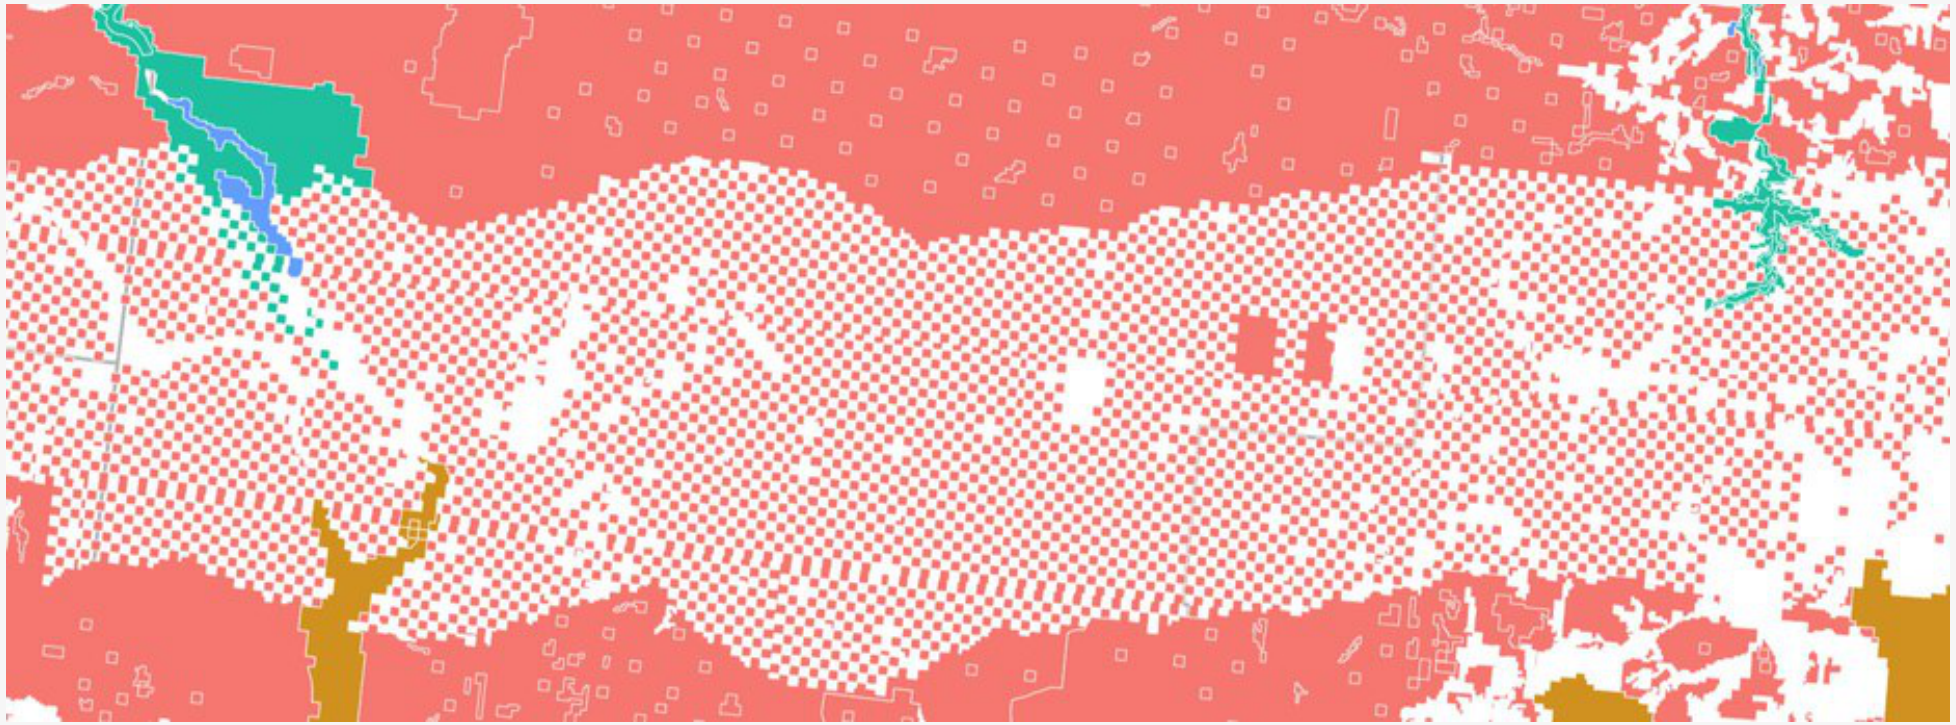


Pretty, Big, and Pretty Empty

Aside: What the hell's that?

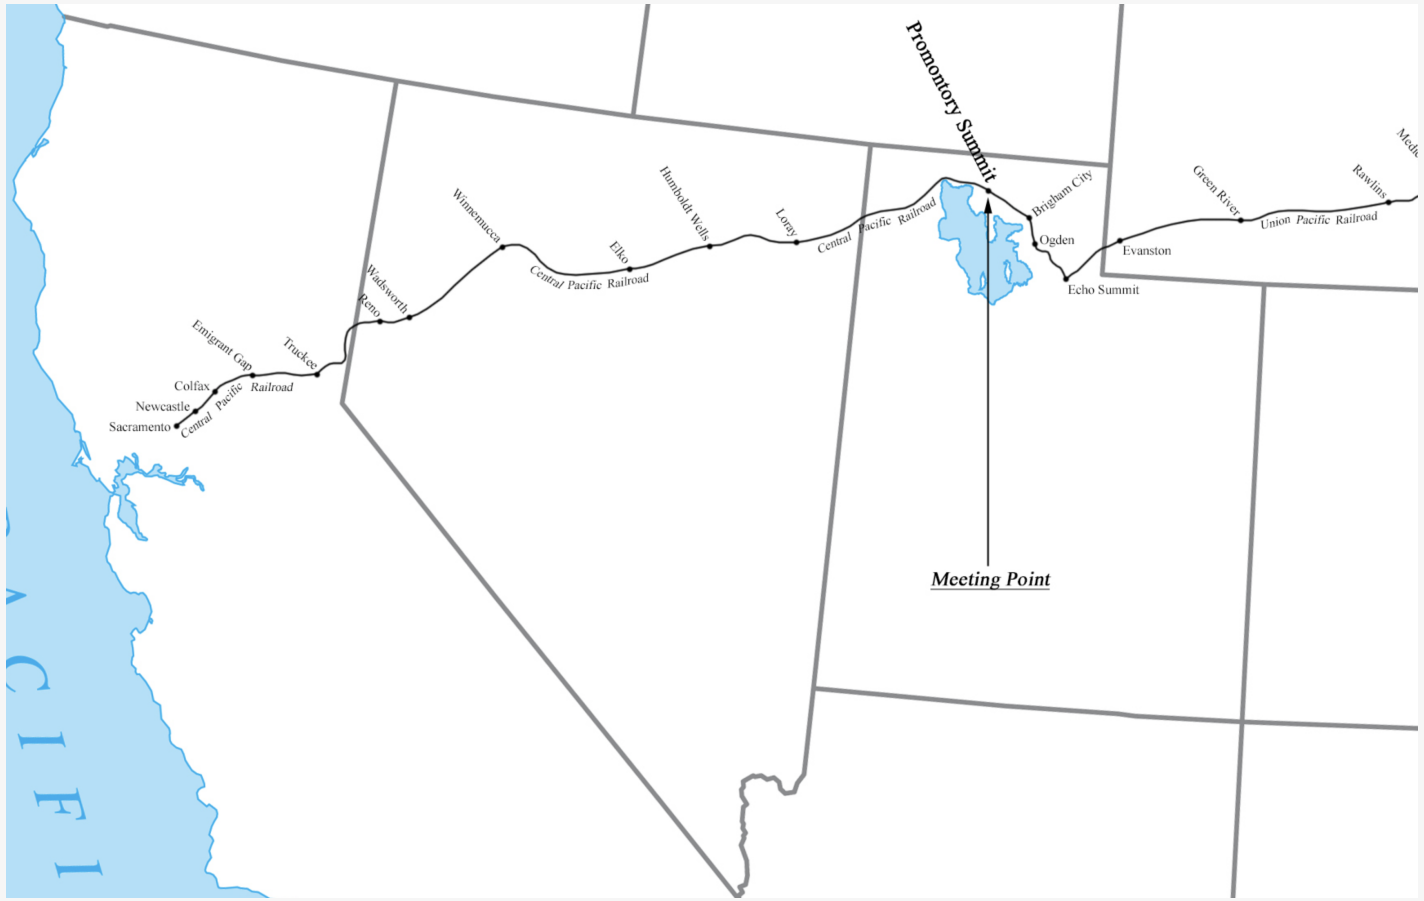


Zoom and Enhance



Suprisingly, not a coding error on my part.

It's the Transcontinental Railroad



Making its way through the Great Basin, America's largest endorheic watershed. The checkerboard is a deliberate assignation of property rights along the borders of the railway line.

Still with us, too

Not identical, as Interstate 80 was able to go through some parts the railroad had to go around. OK, now back to scheduled programming.

Maps as polygons

Packages

```
library(here)       # manage file paths
library(socviz)     # data and some useful functions
library(tidyverse)  # your friend and mine
library(maps)       # Some basic maps
library(ggforce)    # ggplot extensions
```

Take a look at this data

```
## This is from the map library
# library(maps)

us_states ← map_data("state")

dim(us_states)
```

```
[1] 15537     6
```

```
## Making it a tibble prevents crashes
## in the slide rendering later on
us_states ← as_tibble(us_states)

us_states
```

```
# A tibble: 15,537 × 6
    long   lat group order region  subregion
   <dbl> <dbl> <dbl> <int> <chr>   <chr>
 1 -87.5  30.4     1     1 alabama <NA>
 2 -87.5  30.4     1     2 alabama <NA>

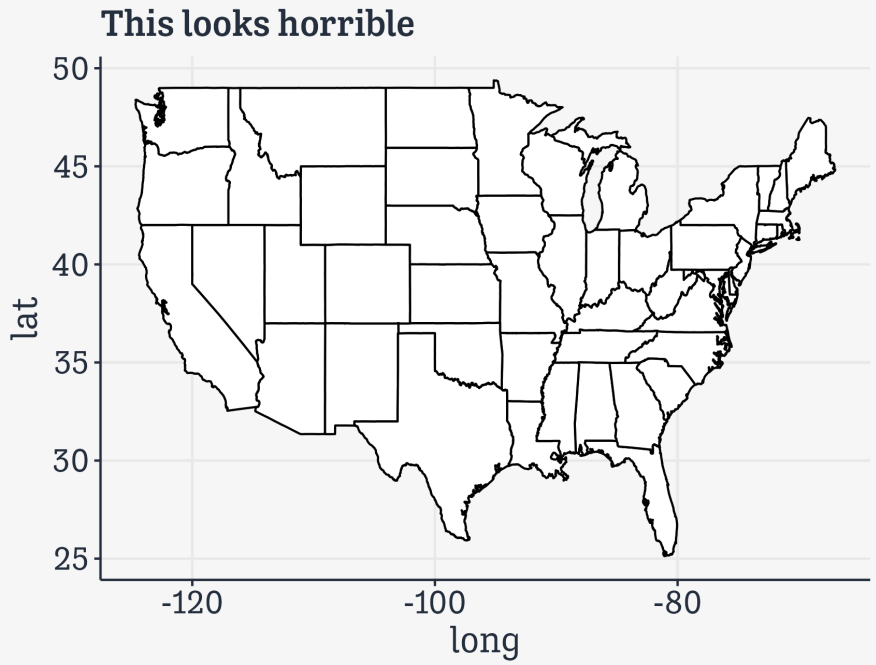
10 -87.8  30.3     1    10 alabama <NA>
# ℹ 15,527 more rows
```

It's a series of rows defining `x` and `y` coordinatates on a plane.

If we join those points up as lines while respecting their `group` (i.e. so `ggplot` knows when to "lift the pen", as with the `gapminder` line plot), we will get an outline map of states in the U.S.

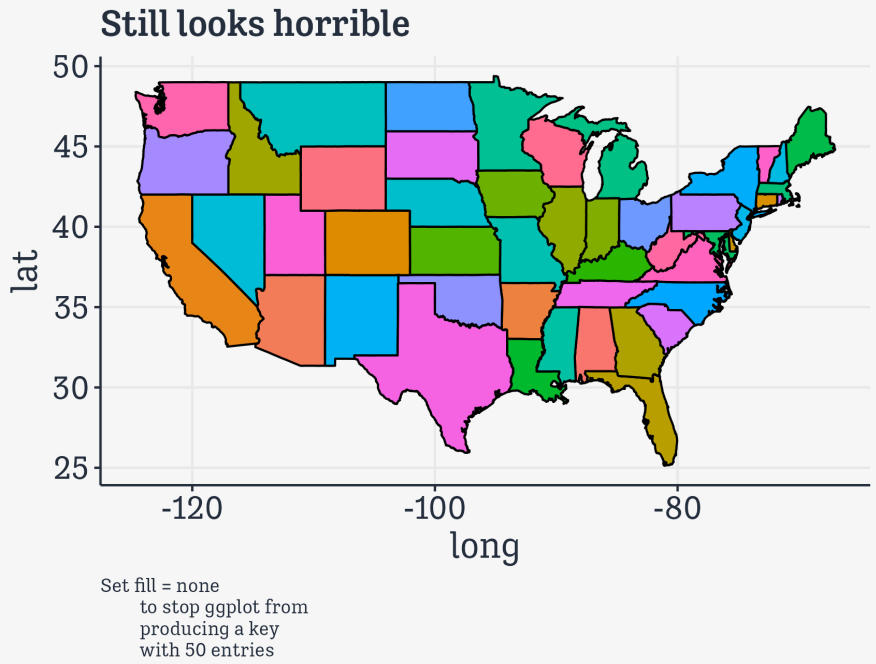
Like this, with `geom_polygon()`

```
us_states ▷
  ggplot(mapping = aes(x = long,
                       y = lat,
                       group = group)) +
  geom_polygon(fill = "white",
               color = "black") +
  labs(title = "This looks horrible")
```



We can show a `fill`, too, like any geom

```
us_states ▷
  ggplot(mapping = aes(x = long,
                       y = lat,
                       fill = region,#<<
                       group = group)) +
  geom_polygon(color = "black") +
  guides(fill = "none") + #<<
  labs(title = "Still looks horrible",
       caption = "Set fill = none
         to stop ggplot from
         producing a key
         with 50 entries")
```



We need to do two things

1: Fix the map projection

2: Add some data to fill with.

For now, we'll do it the direct way

To make explicit what's happening, and to emphasize how *it's all just points and lines made from tables* we'll first do it at the level of the `ggplot` grammar with a geom that just draws shapes, `geom_polygon()`. After that, we'll introduce a new package, `sf` and a new geom, `geom_sf()` that will handle this for us, and more.

Fix the projection

```
1  us_states ← as_tibble(map_data("state"))
```

Fix the projection

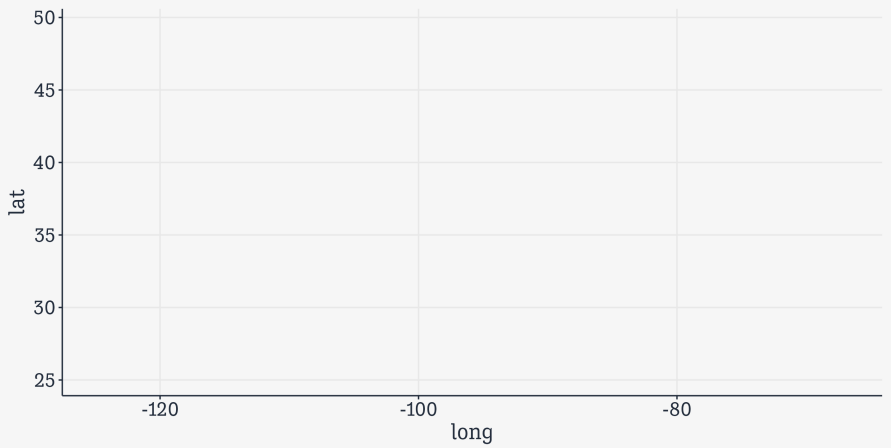
```
1  us_states ← as_tibble(map_data("state"))
2
3  us_states
```

```
# A tibble: 15,537 × 6
    long   lat group order region  subregion
   <dbl> <dbl> <dbl> <int> <chr>   <chr>
 1 -87.5  30.4     1     1 alabama <NA>
 2 -87.5  30.4     1     2 alabama <NA>
 3 -87.5  30.4     1     3 alabama <NA>
 4 -87.5  30.3     1     4 alabama <NA>
 5 -87.6  30.3     1     5 alabama <NA>
 6 -87.6  30.3     1     6 alabama <NA>
 7 -87.6  30.3     1     7 alabama <NA>
 8 -87.6  30.3     1     8 alabama <NA>
 9 -87.7  30.3     1     9 alabama <NA>
10 -87.8  30.3     1    10 alabama <NA>
# ℹ 15,527 more rows
```

Fix the projection

```
us_states ← as_tibble(map_data("state"))

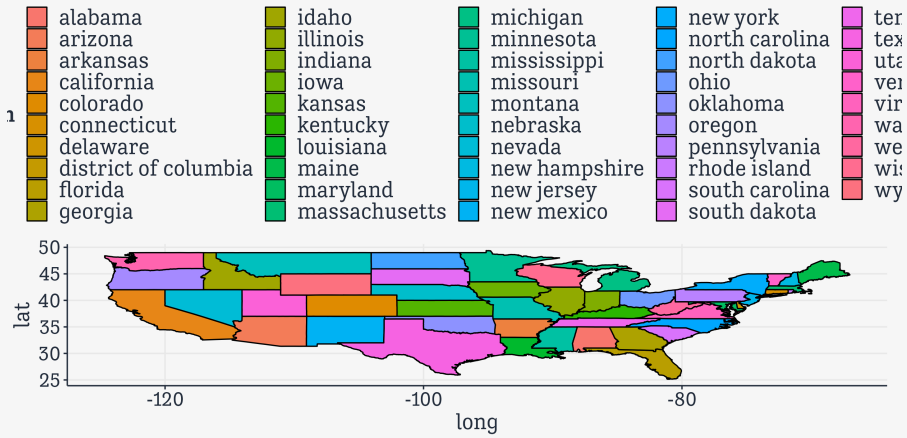
us_states ▷
  ggplot(mapping = aes(x = long,
                       y = lat,
                       fill = region,
                       group = group))
```



Fix the projection

```
us_states ← as_tibble(map_data("state"))

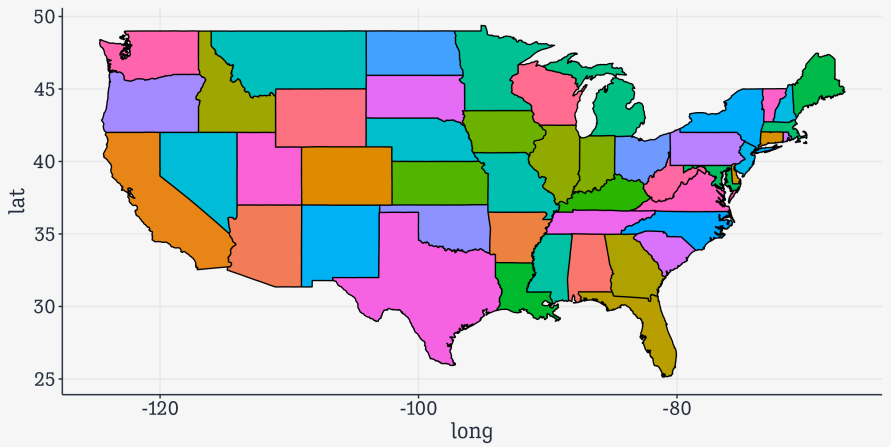
us_states ▷
  ggplot(mapping = aes(x = long,
                       y = lat,
                       fill = region,
                       group = group)) +
  geom_polygon(color = "black")
```



Fix the projection

```
us_states ← as_tibble(map_data("state"))

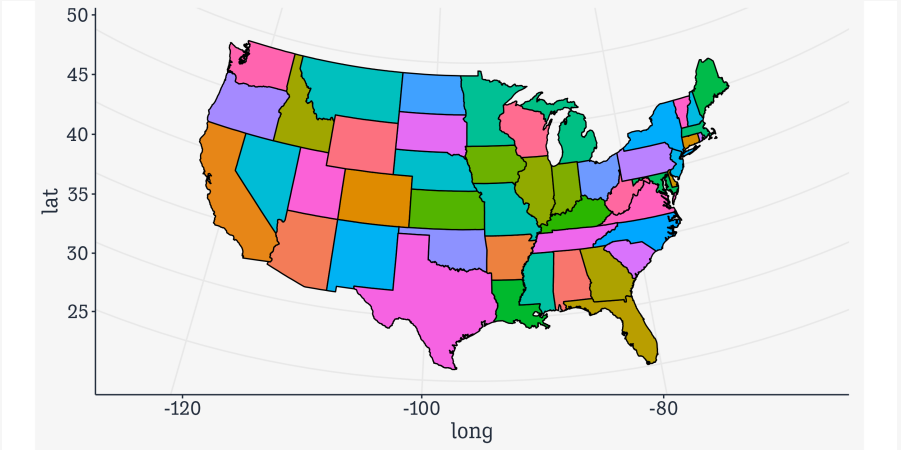
us_states ▷
  ggplot(mapping = aes(x = long,
                       y = lat,
                       fill = region,
                       group = group)) +
  geom_polygon(color = "black") +
  guides(fill = "none")
```



Fix the projection

```r
us_states ← as_tibble(map_data("state"))

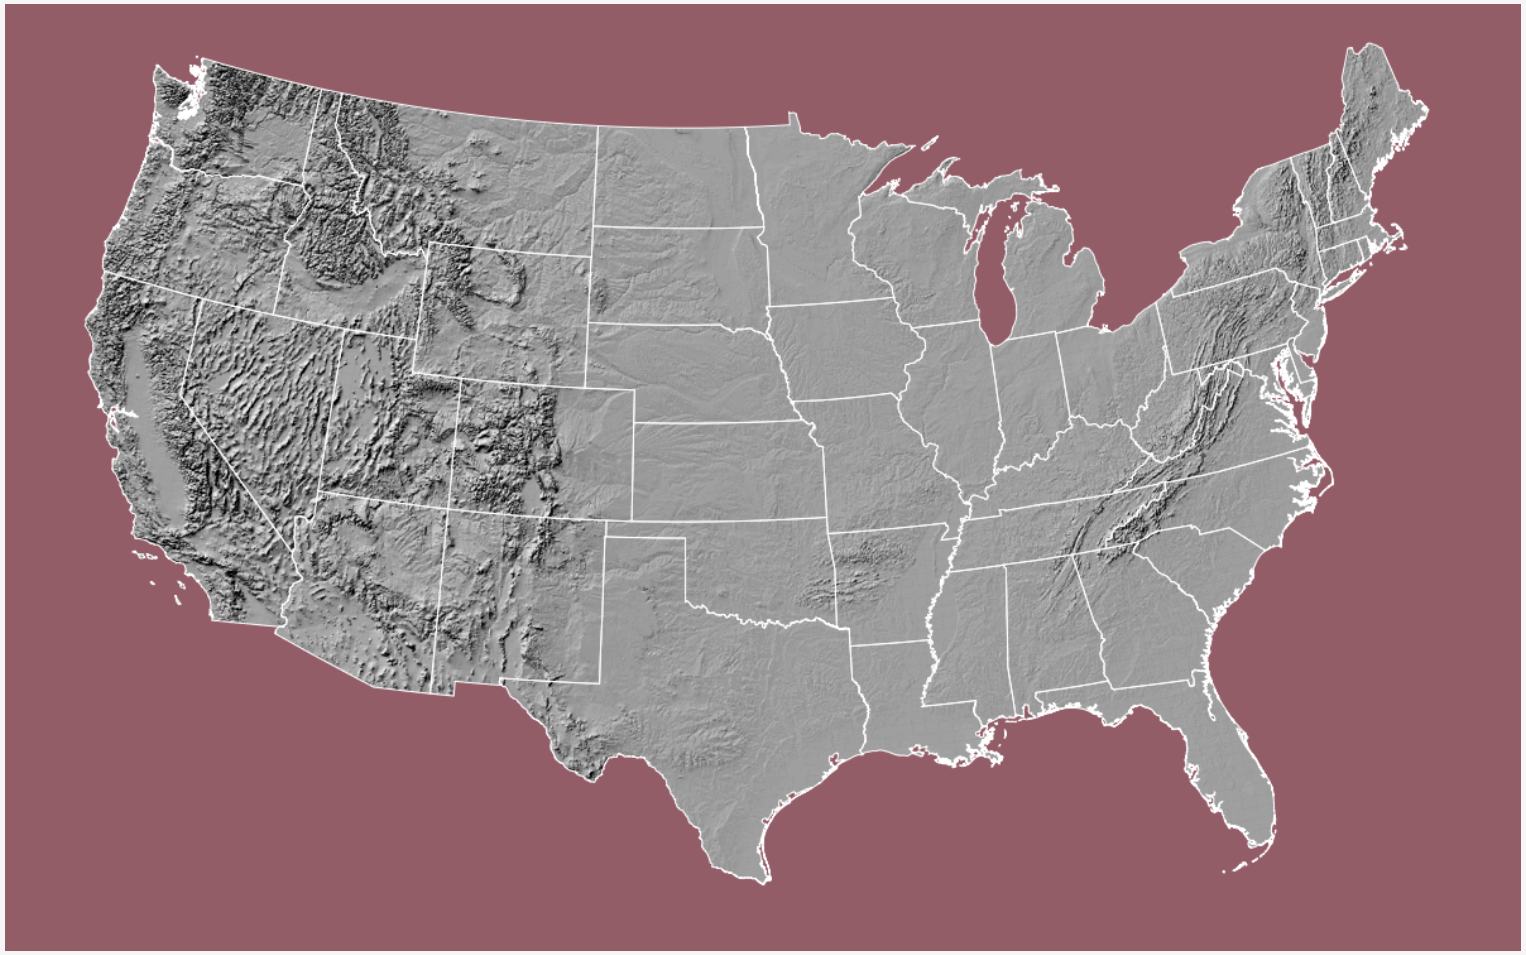
us_states ▷
  ggplot(mapping = aes(x = long,
                       y = lat,
                       fill = region,
                       group = group)) +
  geom_polygon(color = "black") +
  guides(fill = "none") +
  coord_map(projection = "albers",
            lat0 = 39,
            lat1 = 45)
```



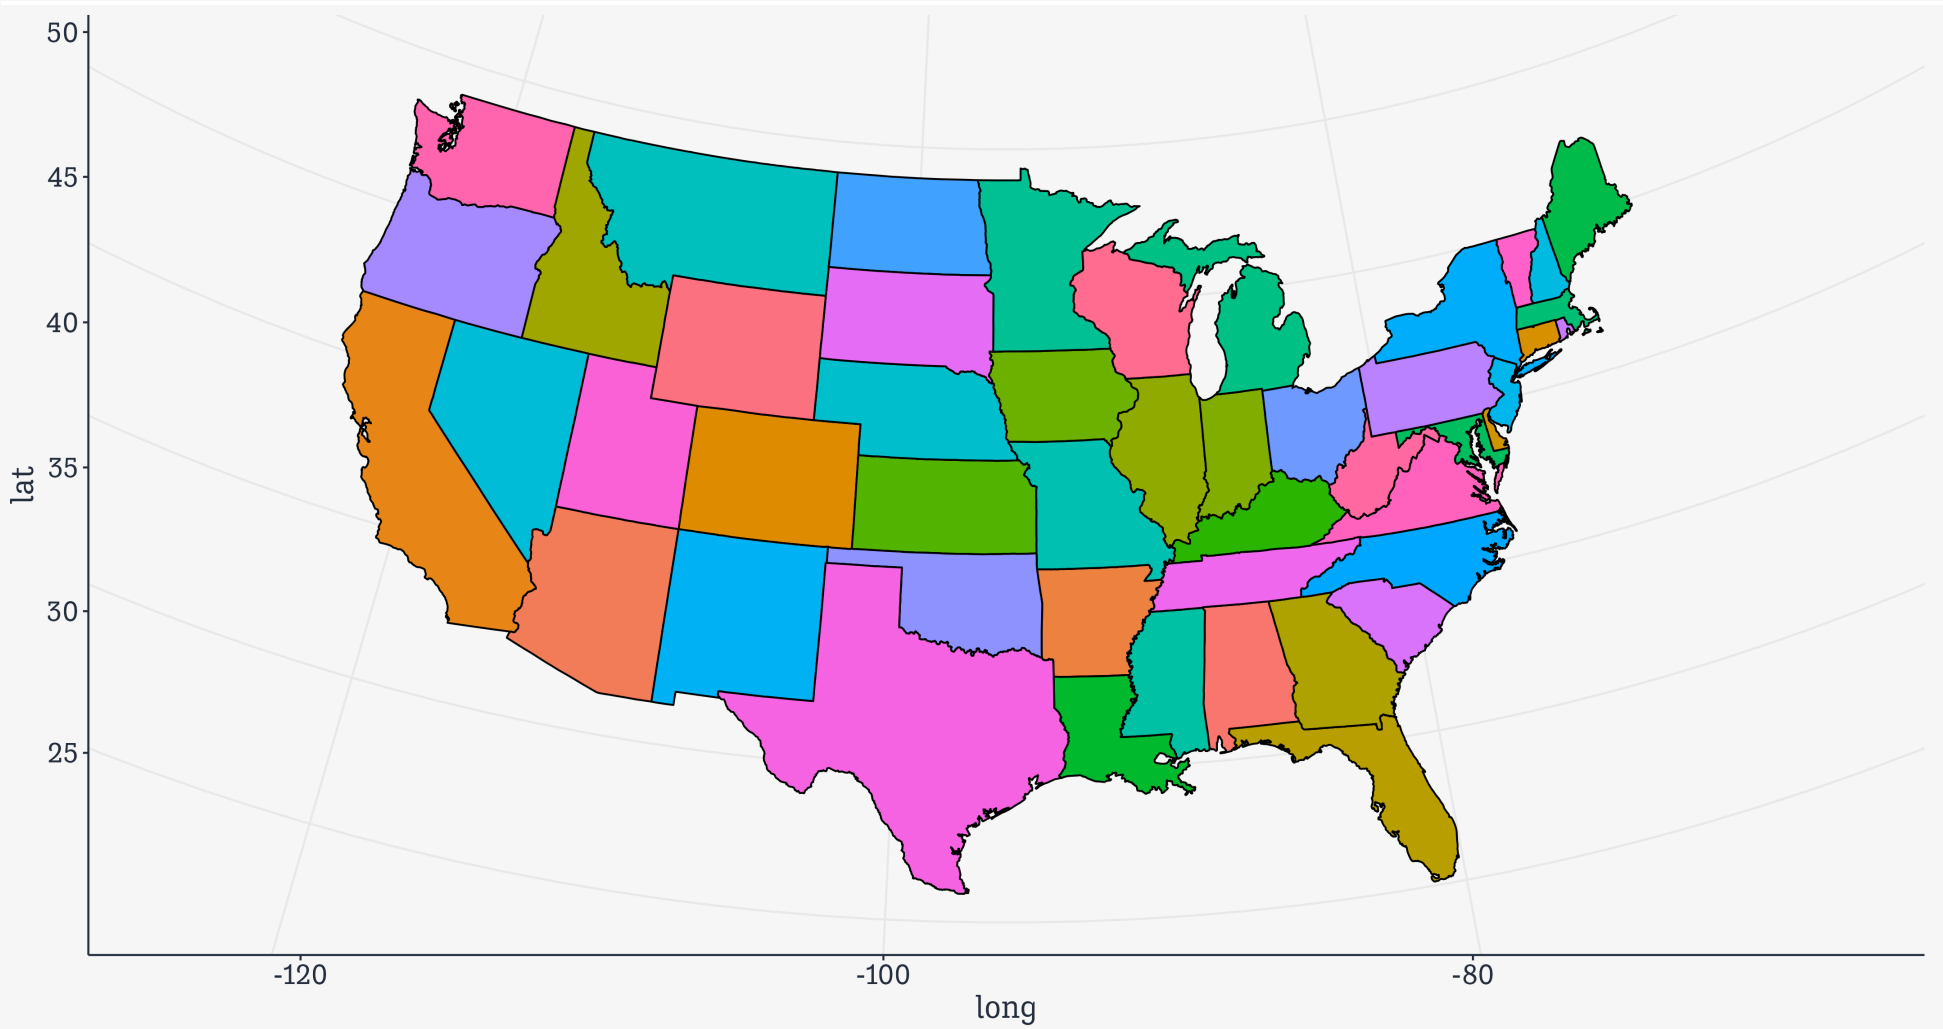
U.S. Map Projections

A selection of projections

U.S. Map Projections



Albers is the standard



Our U.S. Map again, now transformed

Next, some data

We can merge our state-level `election` data with the `us_states` table, but we need to do a little work.

`us_states`

```
# A tibble: 15,537 × 6
    long   lat group order region  subregion
   <dbl> <dbl> <dbl> <int> <chr>   <chr>
 1 -87.5  30.4     1     1 alabama <NA>
 2 -87.5  30.4     1     2 alabama <NA>
 3 -87.5  30.4     1     3 alabama <NA>
 4 -87.5  30.3     1     4 alabama <NA>
 5 -87.6  30.3     1     5 alabama <NA>
 6 -87.6  30.3     1     6 alabama <NA>
 7 -87.6  30.3     1     7 alabama <NA>
 8 -87.6  30.3     1     8 alabama <NA>
 9 -87.7  30.3     1     9 alabama <NA>
10 -87.8  30.3     1    10 alabama <NA>
# ℹ 15,527 more rows
```

`election`

```
# A tibble: 51 × 22
   state     st     fips total_vote vote_margin
winner party pct_margin r_points
   <chr>     <chr> <dbl>      <dbl>       <dbl>
<chr>  <chr>      <dbl>    <dbl>
 1 Alabama   AL        1    2123372      588708
Trump  Repu…     0.277     27.7
 2 Alaska    AK        2     318608       46933
Trump  Repu…     0.147     14.7
 3 Arizona   AZ        4    2604657       91234

#   ev_rep <dbl>, ev_oth <dbl>, census <chr>
```

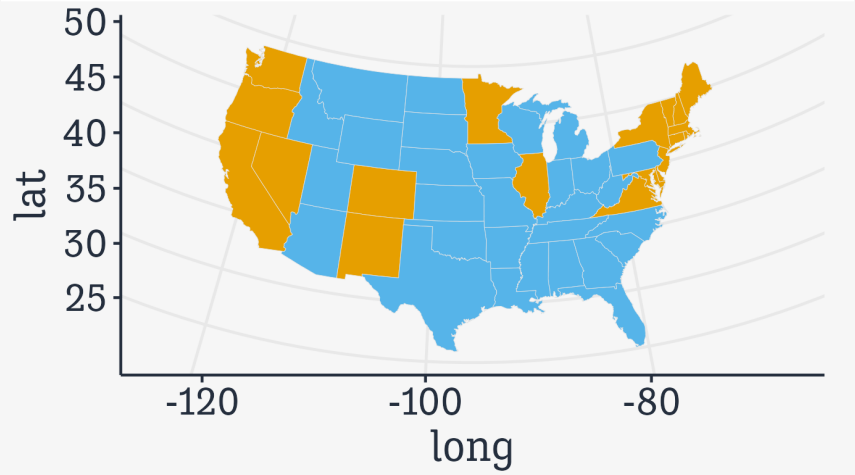
Now our `us_states_elec` table has both the line-drawing information and (very redundantly) the election data merged in, with rows repeated as

Choropleths

```
us_states_elec ▷
  ggplot(mapping = aes(x = long,
                       y = lat,
                       fill = party,#<<
                       group = group)) +
  geom_polygon(color = "gray90",
               size = 0.1) +
  coord_map(projection = "albers",
            lat0 = 39, lat1 = 45) +
  guides(fill = "none")
```



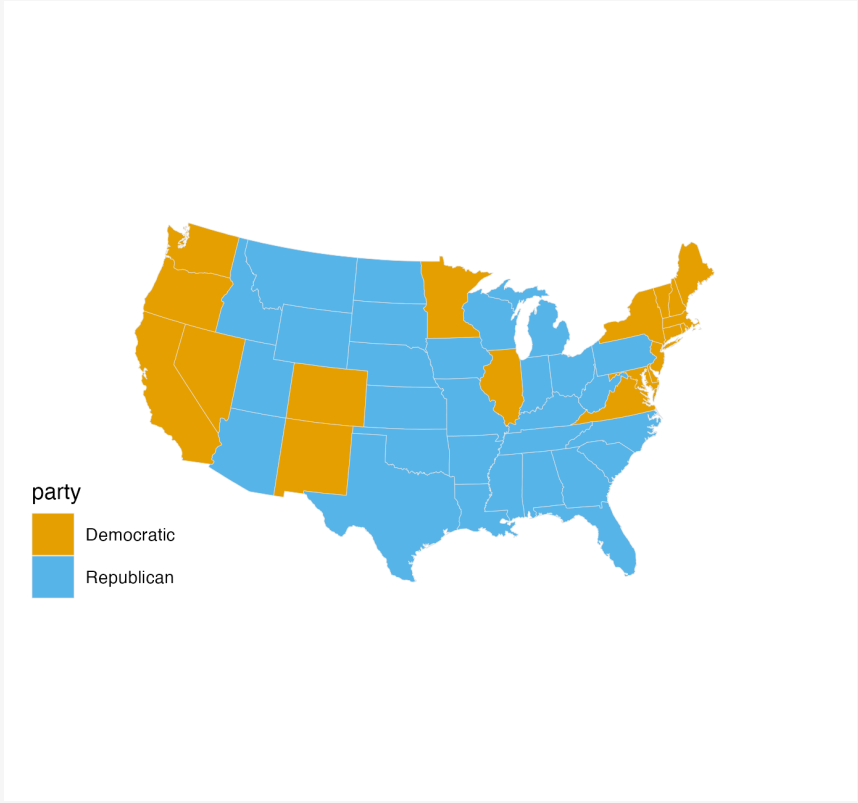
Let's turn off the gridlines

This is a *theme function*.

```
theme_map ← function(base_size=9, base_family="") {
    require(grid)
    theme_bw(base_size=base_size, base_family=base_family) %+replace%
        theme(axis.line=element_blank(),
              axis.text=element_blank(),
              axis.ticks=element_blank(),
              axis.title=element_blank(),
              panel.background=element_blank(),
              panel.border=element_blank(),
              panel.grid=element_blank(),
              panel.spacing=unit(0, "lines"),
              plot.background=element_blank(),
              legend.justification = c(0,0),
              legend.position = c(0,0)
              )
}
```

Add the theme function at the end

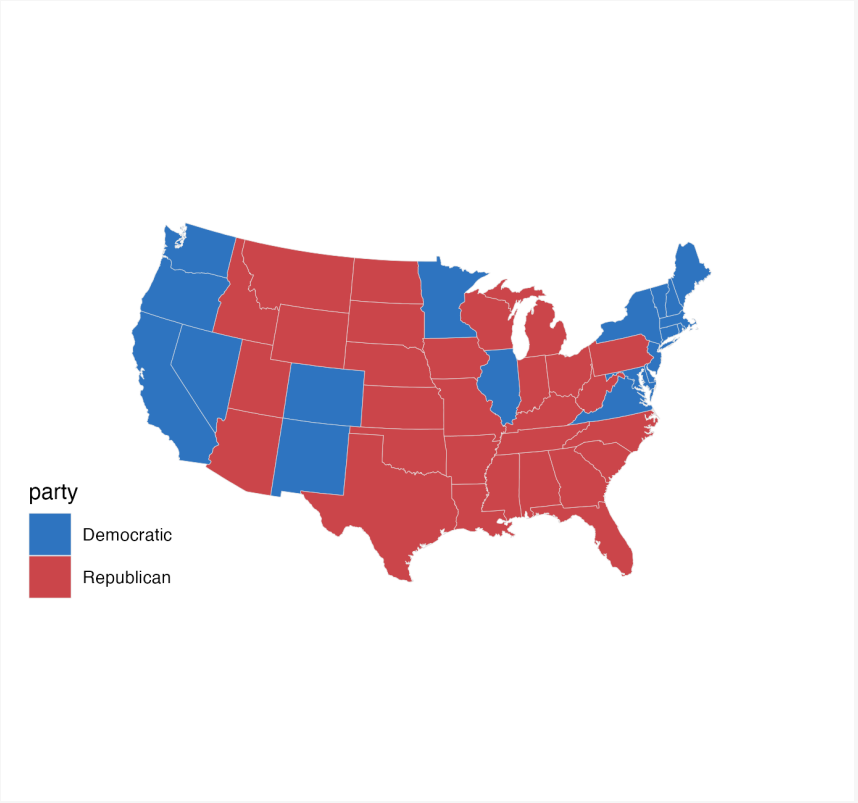
```
us_states_elec ▷
  ggplot(mapping = aes(x = long,
                       y = lat,
                       fill = party,#<<
                       group = group)) +
  geom_polygon(color = "gray90",
               size = 0.1) +
  coord_map(projection = "albers",
            lat0 = 39, lat1 = 45) +
  theme_map()
```



Fix the Party Colors

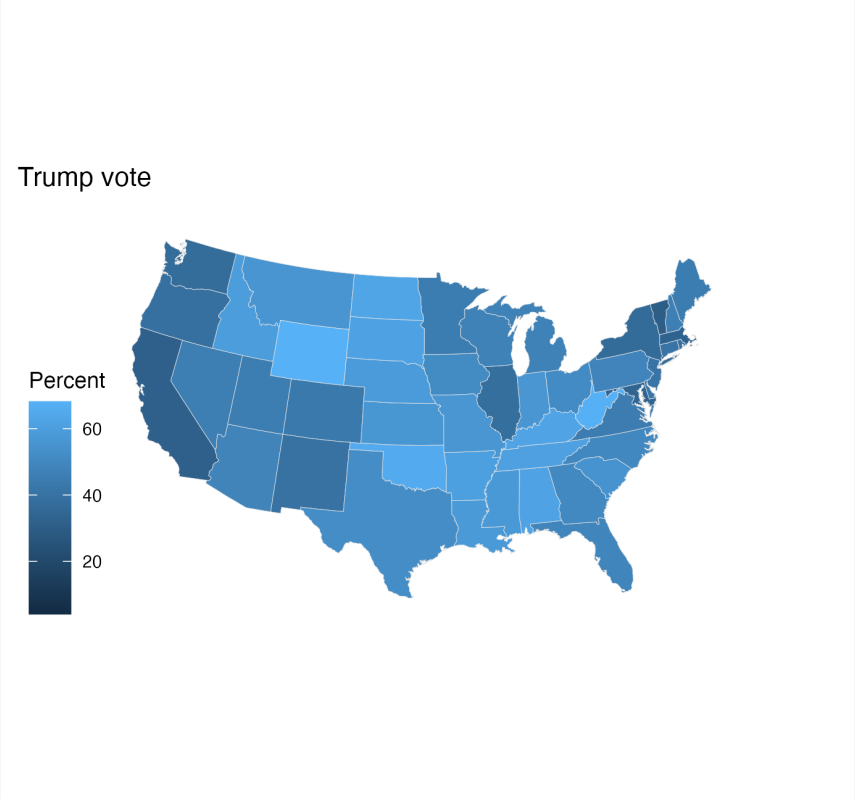
```
## Hex color codes for Democratic Blue and Repu
party_colors ← c("#2E74C0", "#CB454A")

us_states_elec ▷
  ggplot(mapping = aes(x = long,
                       y = lat,
                       fill = party,#<<
                       group = group)) +
  geom_polygon(color = "gray90",
               size = 0.1) +
  scale_fill_manual(values = party_colors) +
  coord_map(projection = "albers",
            lat0 = 39, lat1 = 45) +
  theme_map()
```



Continuous measures are *gradients*

```
us_states_elec ▷
  ggplot(mapping = aes(x = long,
                       y = lat,
                       fill = pct_trump,#<<
                       group = group)) +
  geom_polygon(color = "gray90",
               size = 0.1) +
  coord_map(projection = "albers",
            lat0 = 39, lat1 = 45) +
  labs(title = "Trump vote",
       fill = "Percent") +
  theme_map()
```



Fix the gradient with a scale function

```
us_states_elec ▷
  ggplot(mapping = aes(x = long,
                       y = lat,
                       fill = pct_trump,

Percent Black, by County, binned

Big counties, few people, rare events

Example: Reverse coding

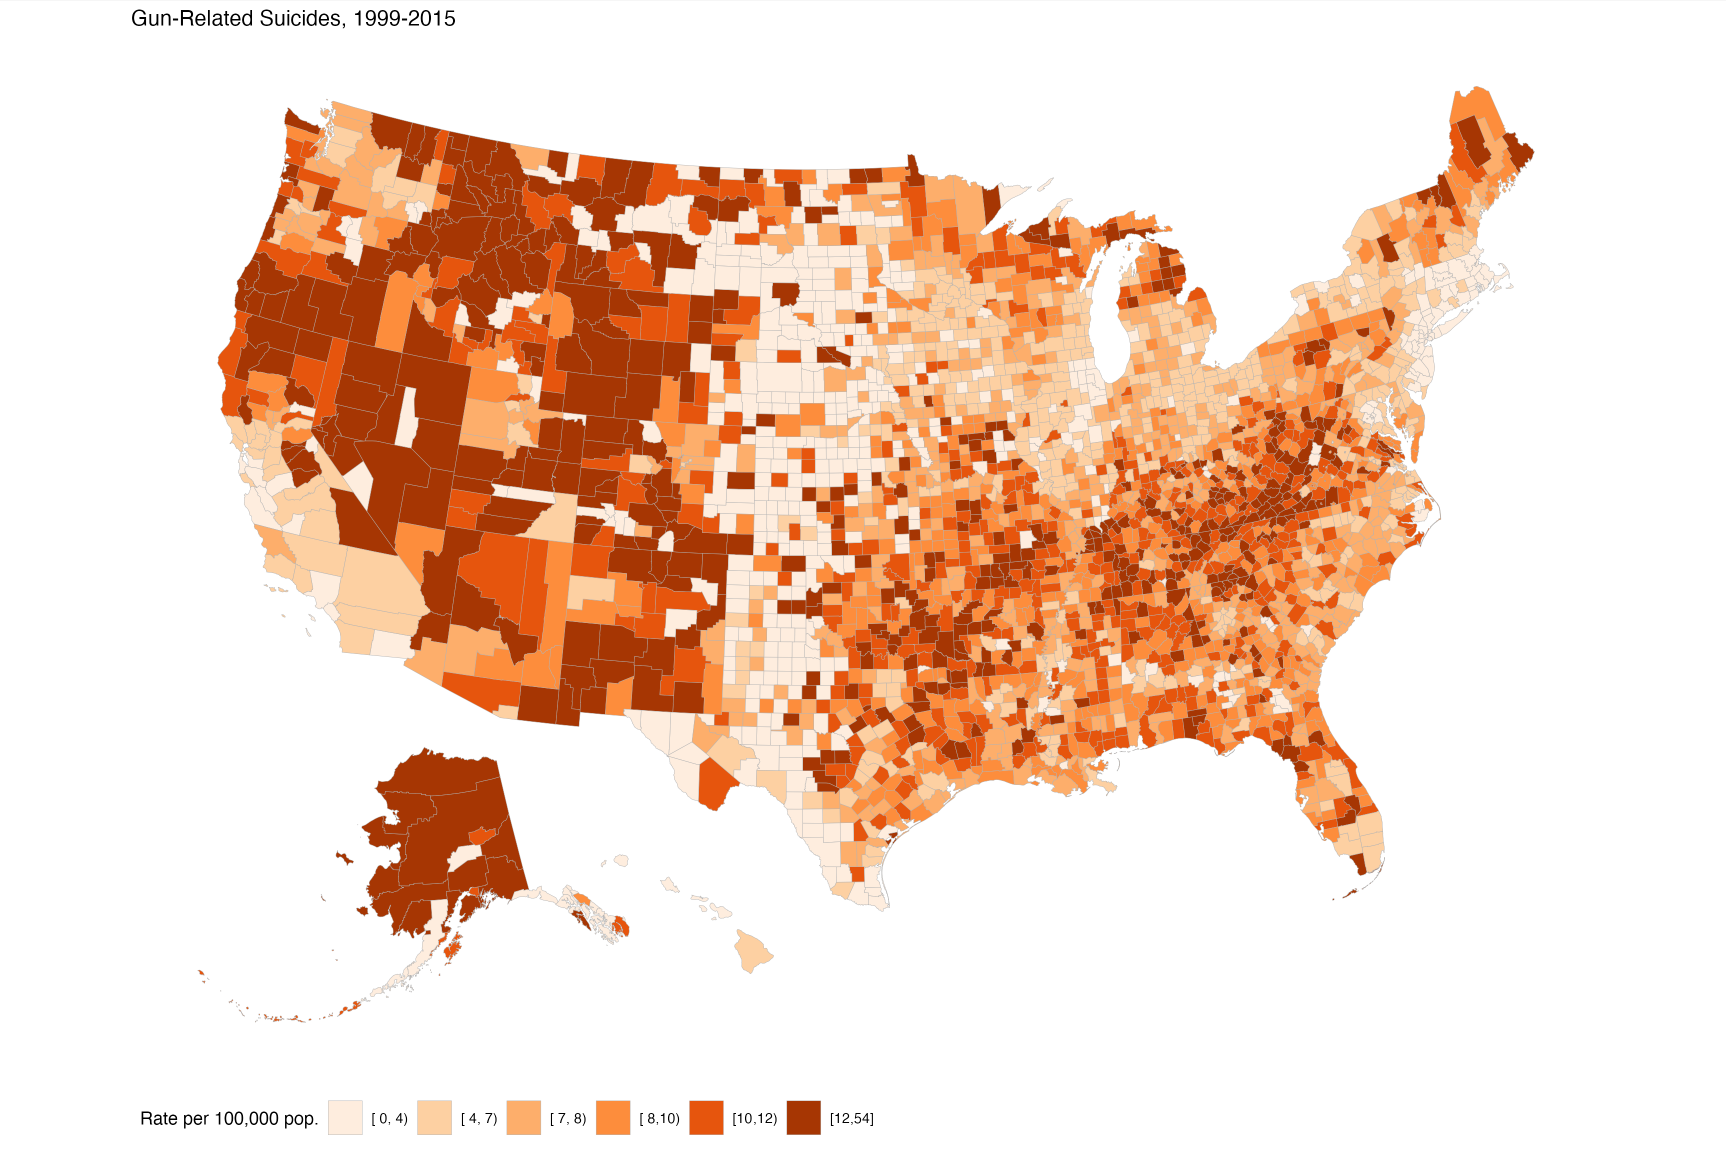
Code | Reverse

```
orange_pal ← RColorBrewer::brewer.pal(n = 6,
                                      name = "Oranges")
orange_pal
```

```
[1] "#FEEDDE" "#FDD0A2" "#FDAE6B" "#FD8D3C" "#E6550D" "#A63603"
```

Build a plot

```
p_g1 ← county_full ▷
  ggplot(mapping = aes(x = long, y = lat,
                       fill = su_gun6, #<<
                       group = group)) +
  geom_polygon(color = "gray70",
               size = 0.1) +
  coord_fixed() +
  scale_fill_manual(values = orange_pal) + #<<
  labs(title = "Gun-Related Suicides, 1999-2015",
       fill = "Rate per 100,000 pop.") +
  theme_map() +
  guides(fill = guide_legend(nrow = 1)) +
  theme(legend.position = "bottom")
```



Regular palette

And another

```
p_g2 ← county_full ▷
  ggplot(mapping = aes(x = long, y = lat,
                       fill = pop_dens6, #<<
                       group = group)) +
  geom_polygon(color = "gray70",
               size = 0.1) +
  coord_fixed() +
  scale_fill_manual(values = orange_rev) + #<<
  labs(title = "Reverse-coded Population Density",
       fill = "Persons per square mile") +
  theme_map() +
  guides(fill = guide_legend(nrow = 1)) +
  theme(legend.position = "bottom")
```
