Making Maps

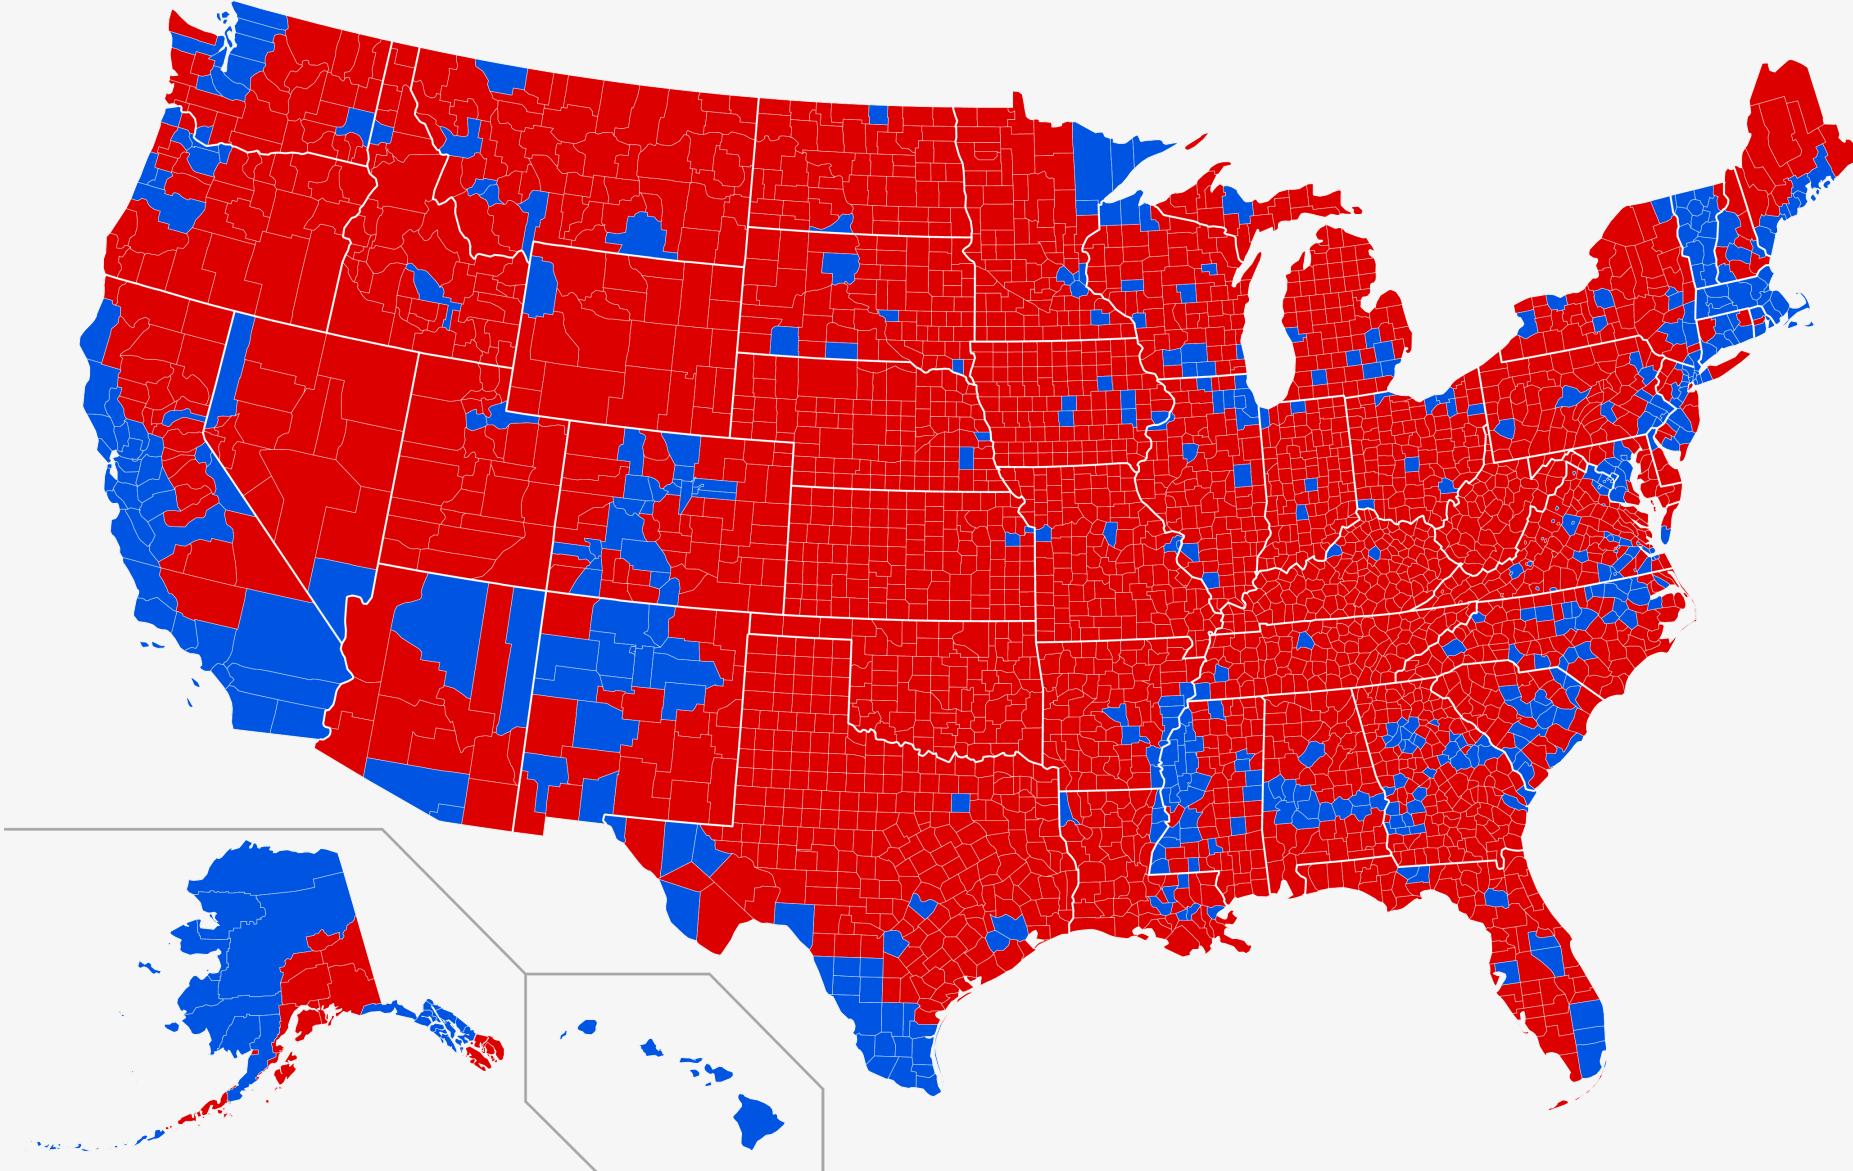

Load our packages

```
library(here)      # manage file paths
library(socviz)    # data and some useful functions
library(tidyverse) # your friend and mine
library(maps)      # Some basic maps
library(sf)        # Simple Features Geometries and geom_sf()
library(ggforce)   # Useful enhancements to ggplot
```

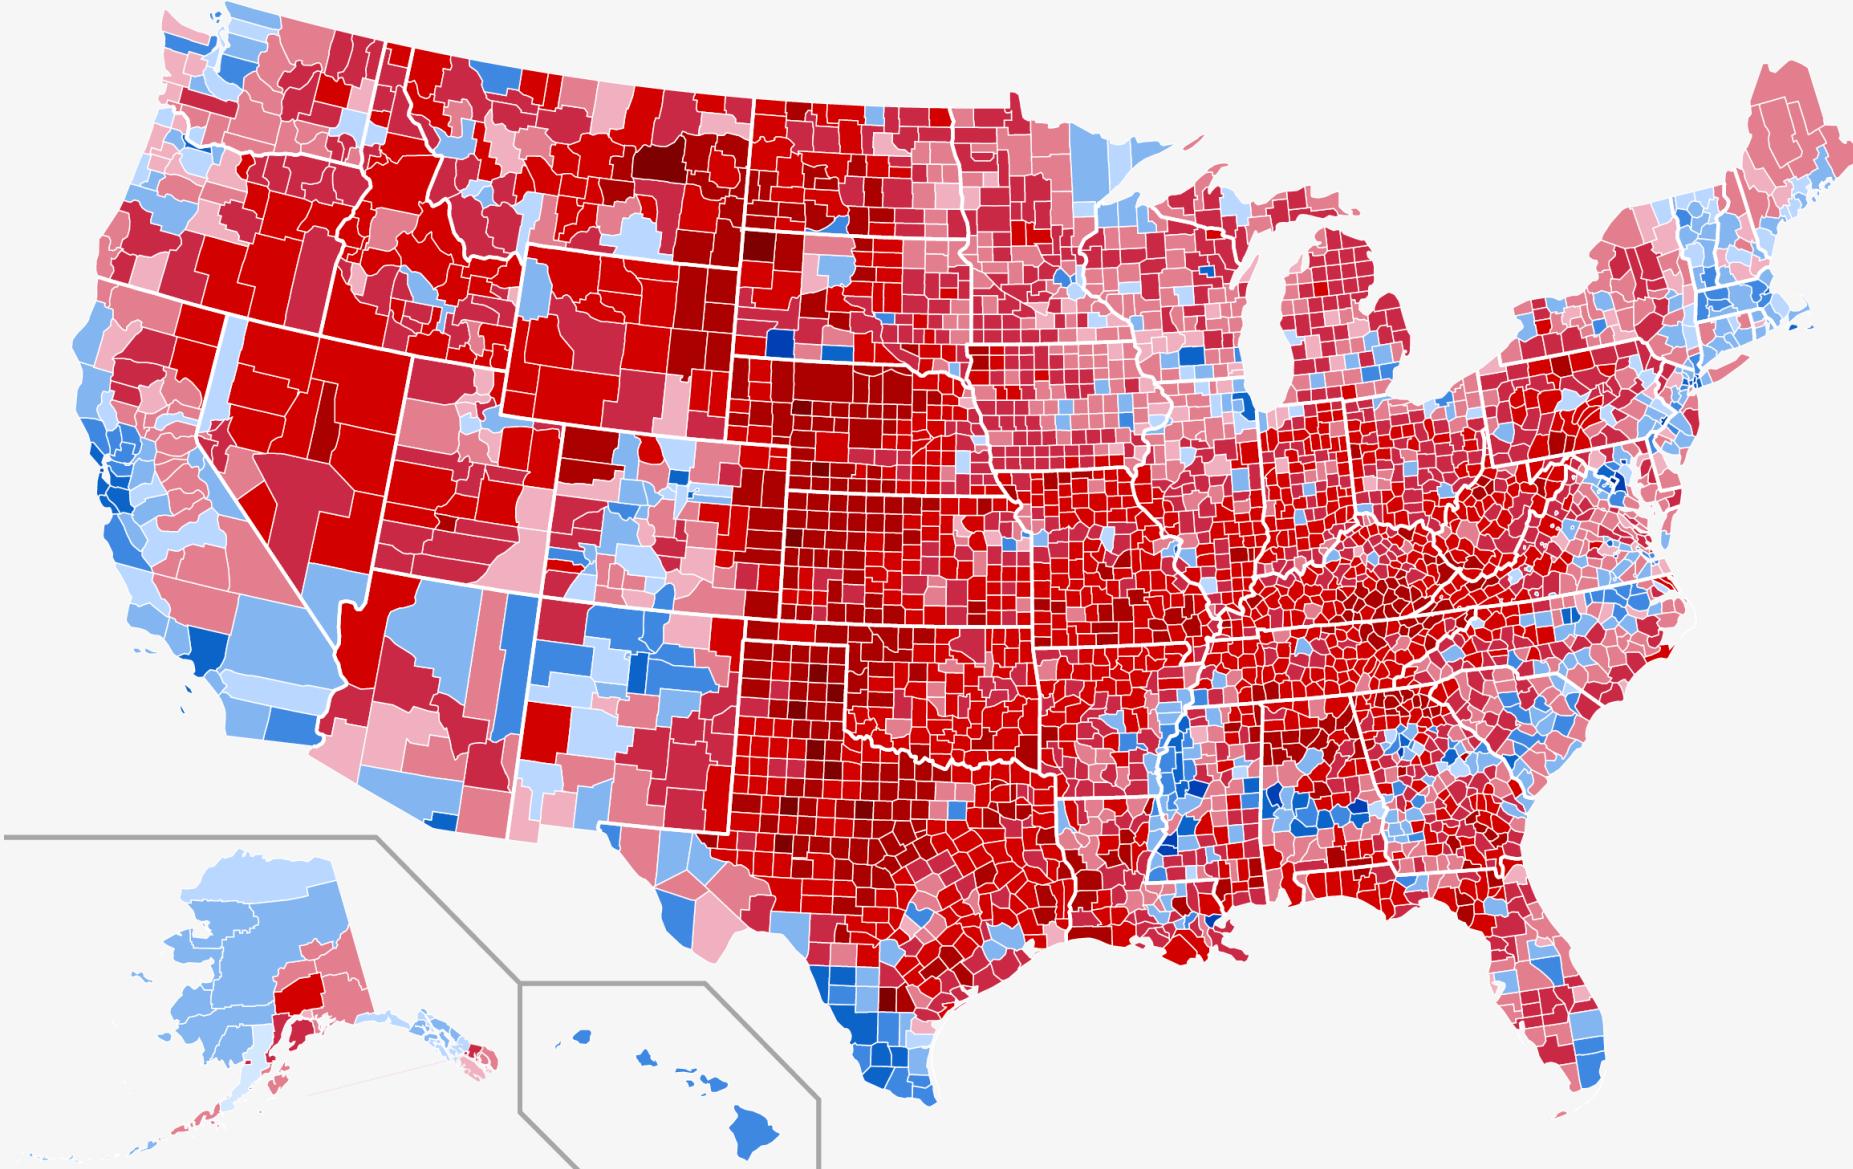

Choropleths

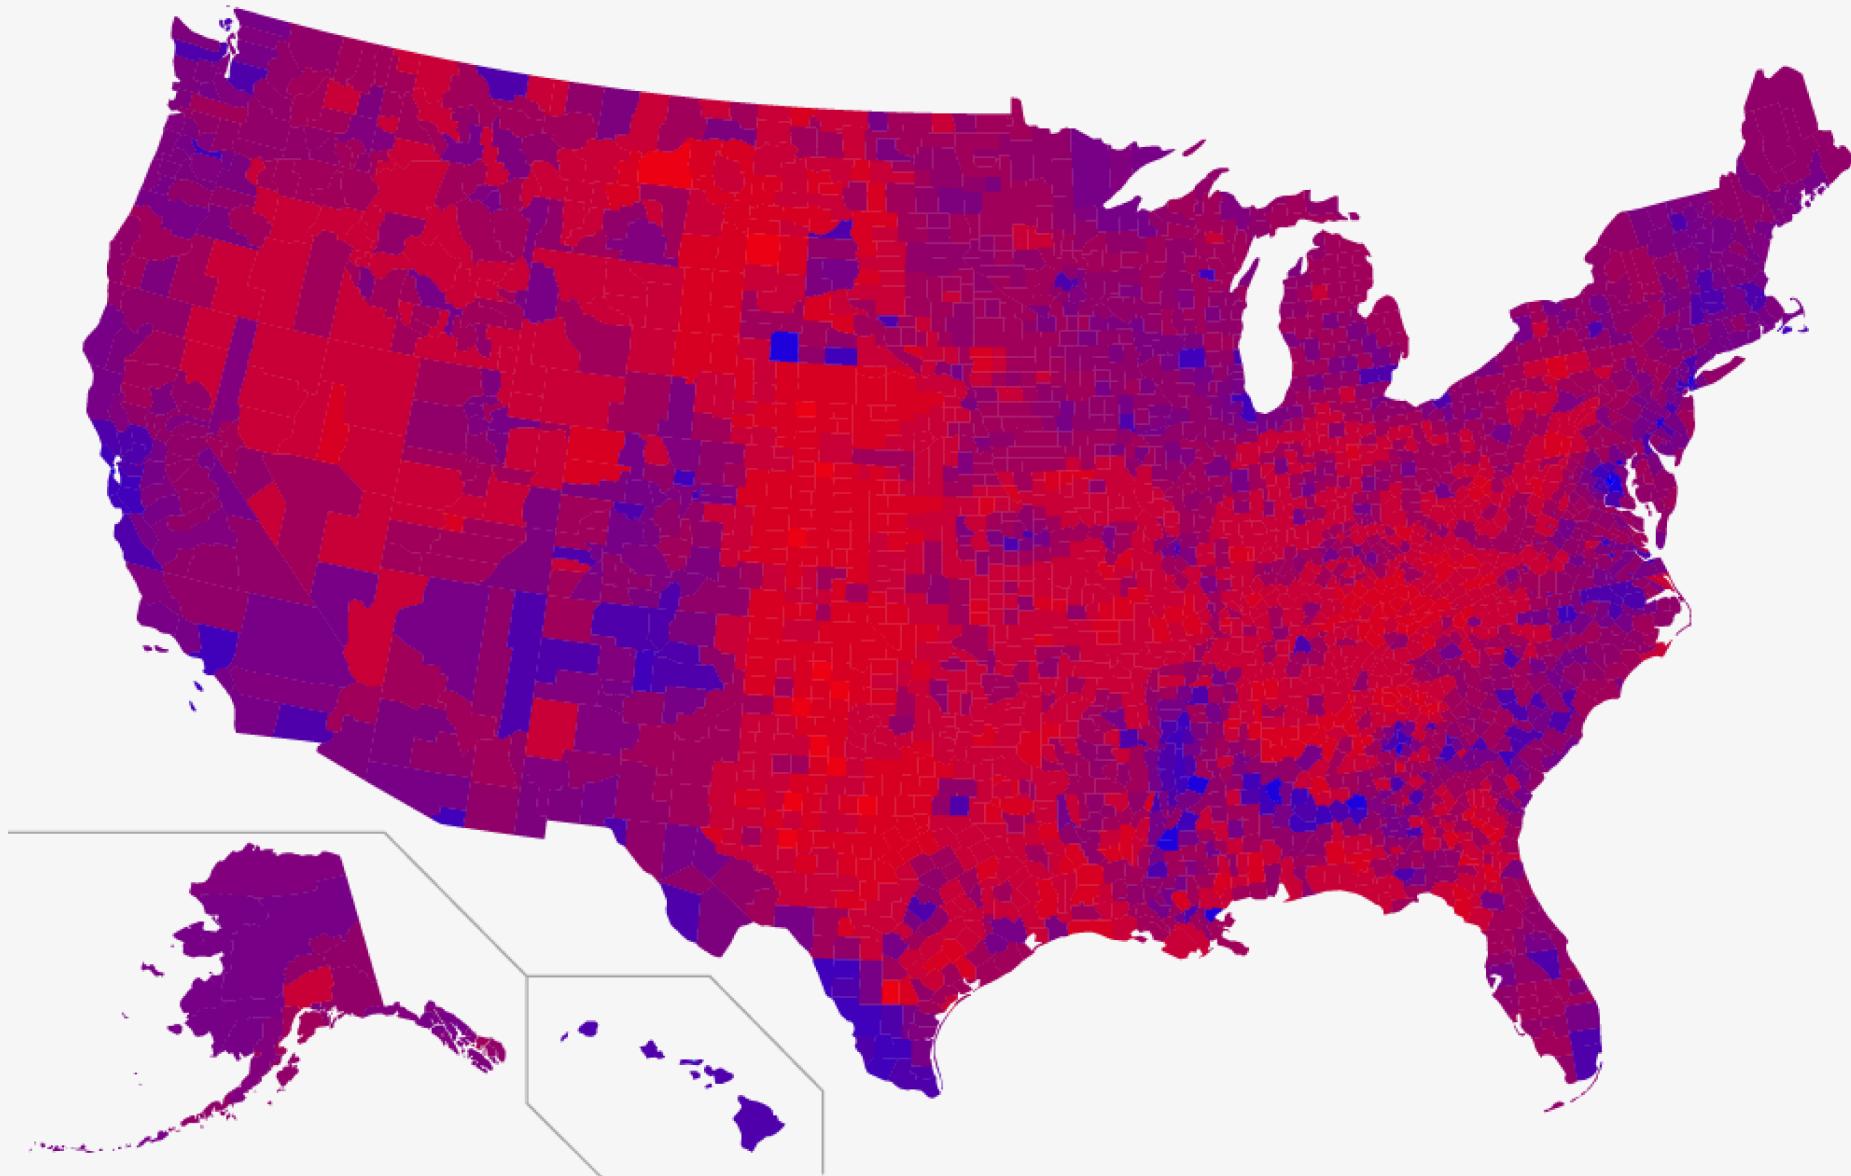

State-level; vote share; diverging; binned into four categories.

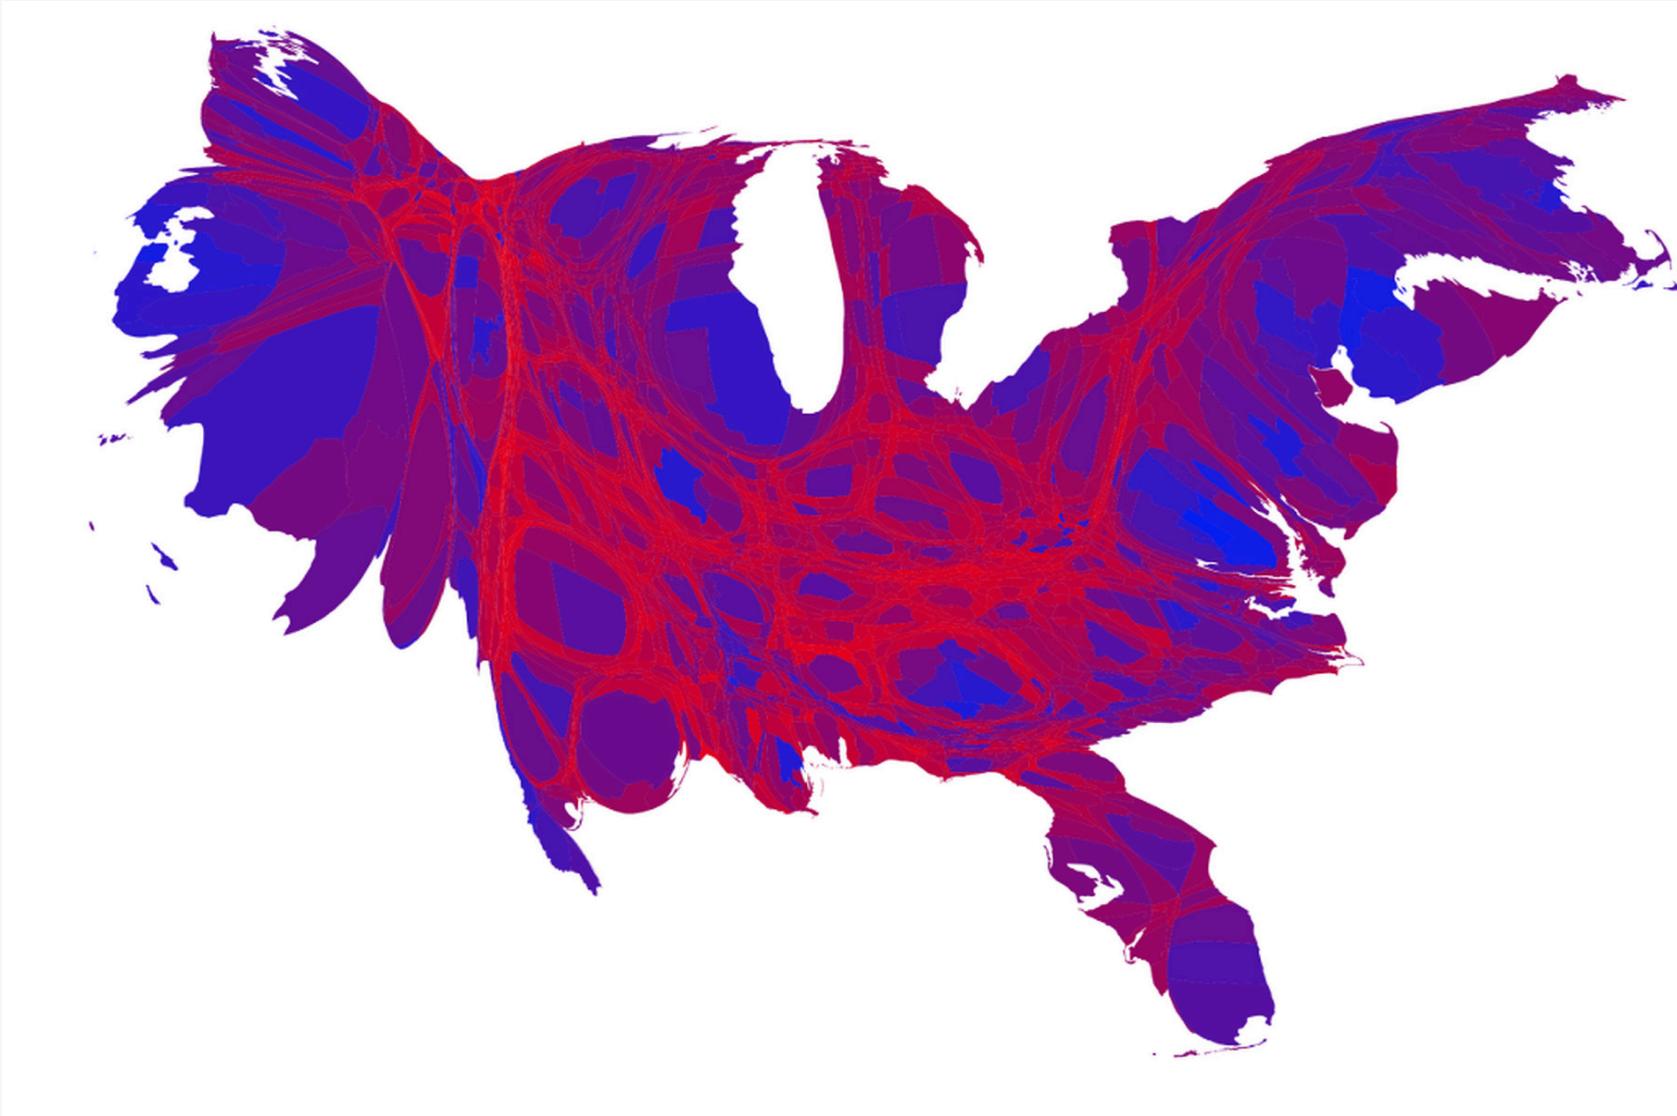

County level; winner only

County level vote share; diverging; binned into six categories

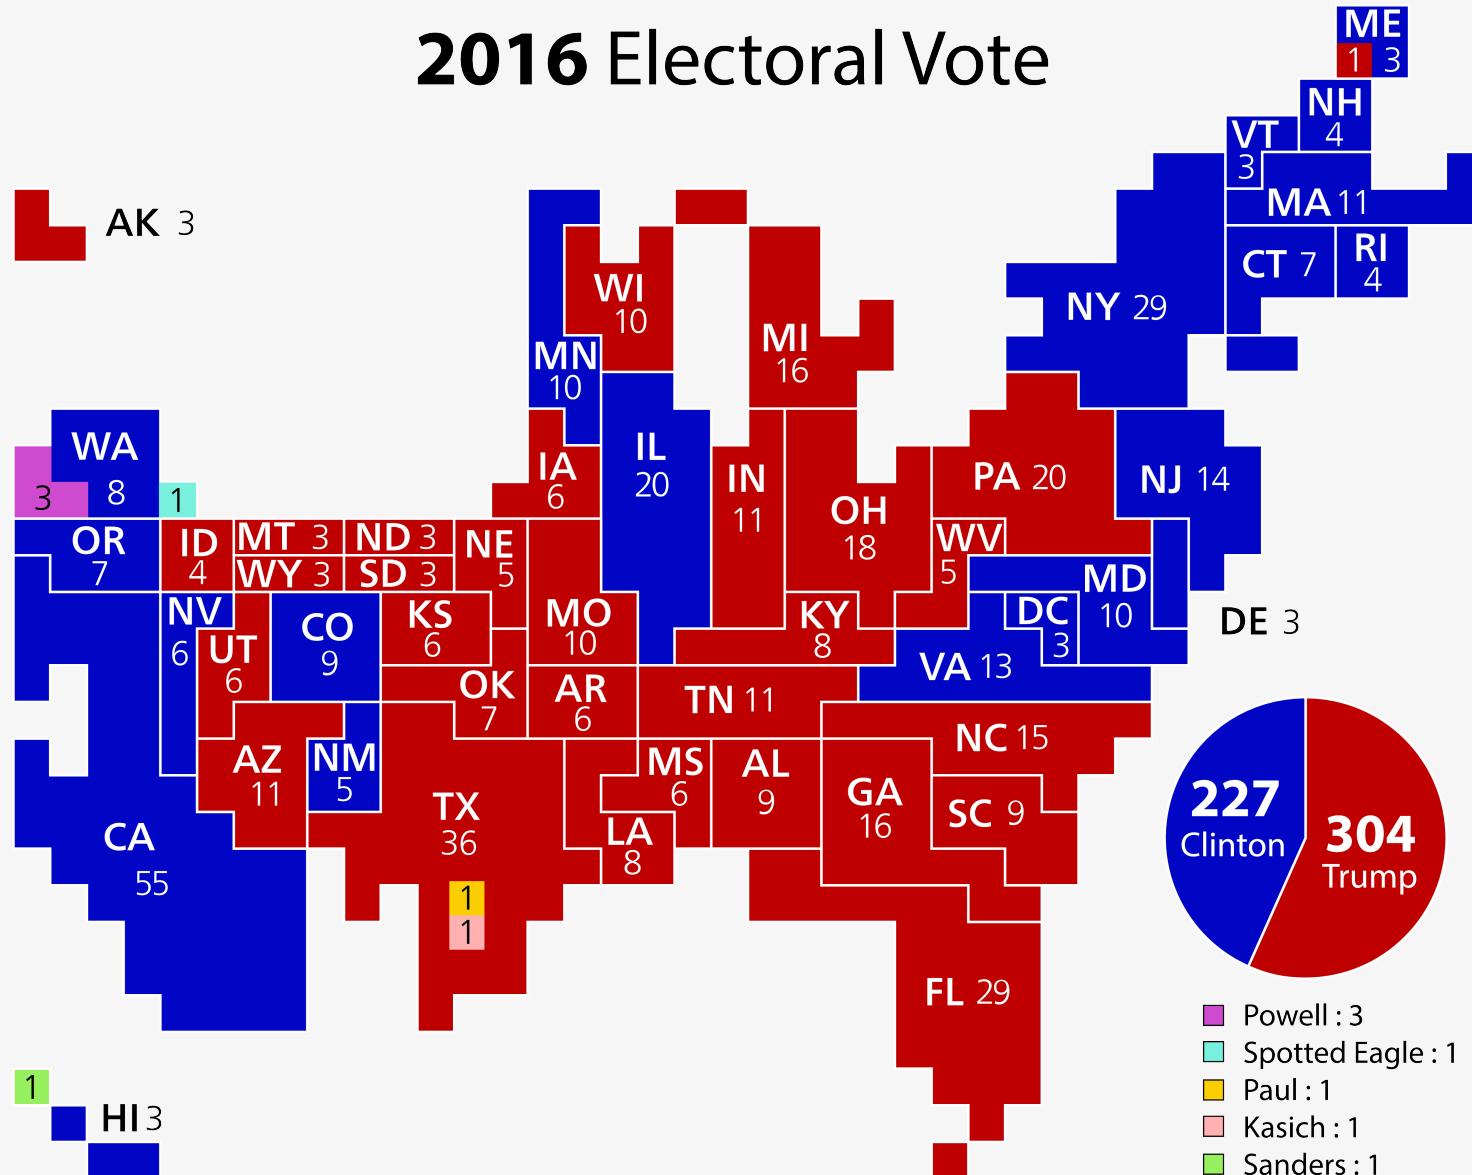

County level vote share; diverging continuous; purple midpoint

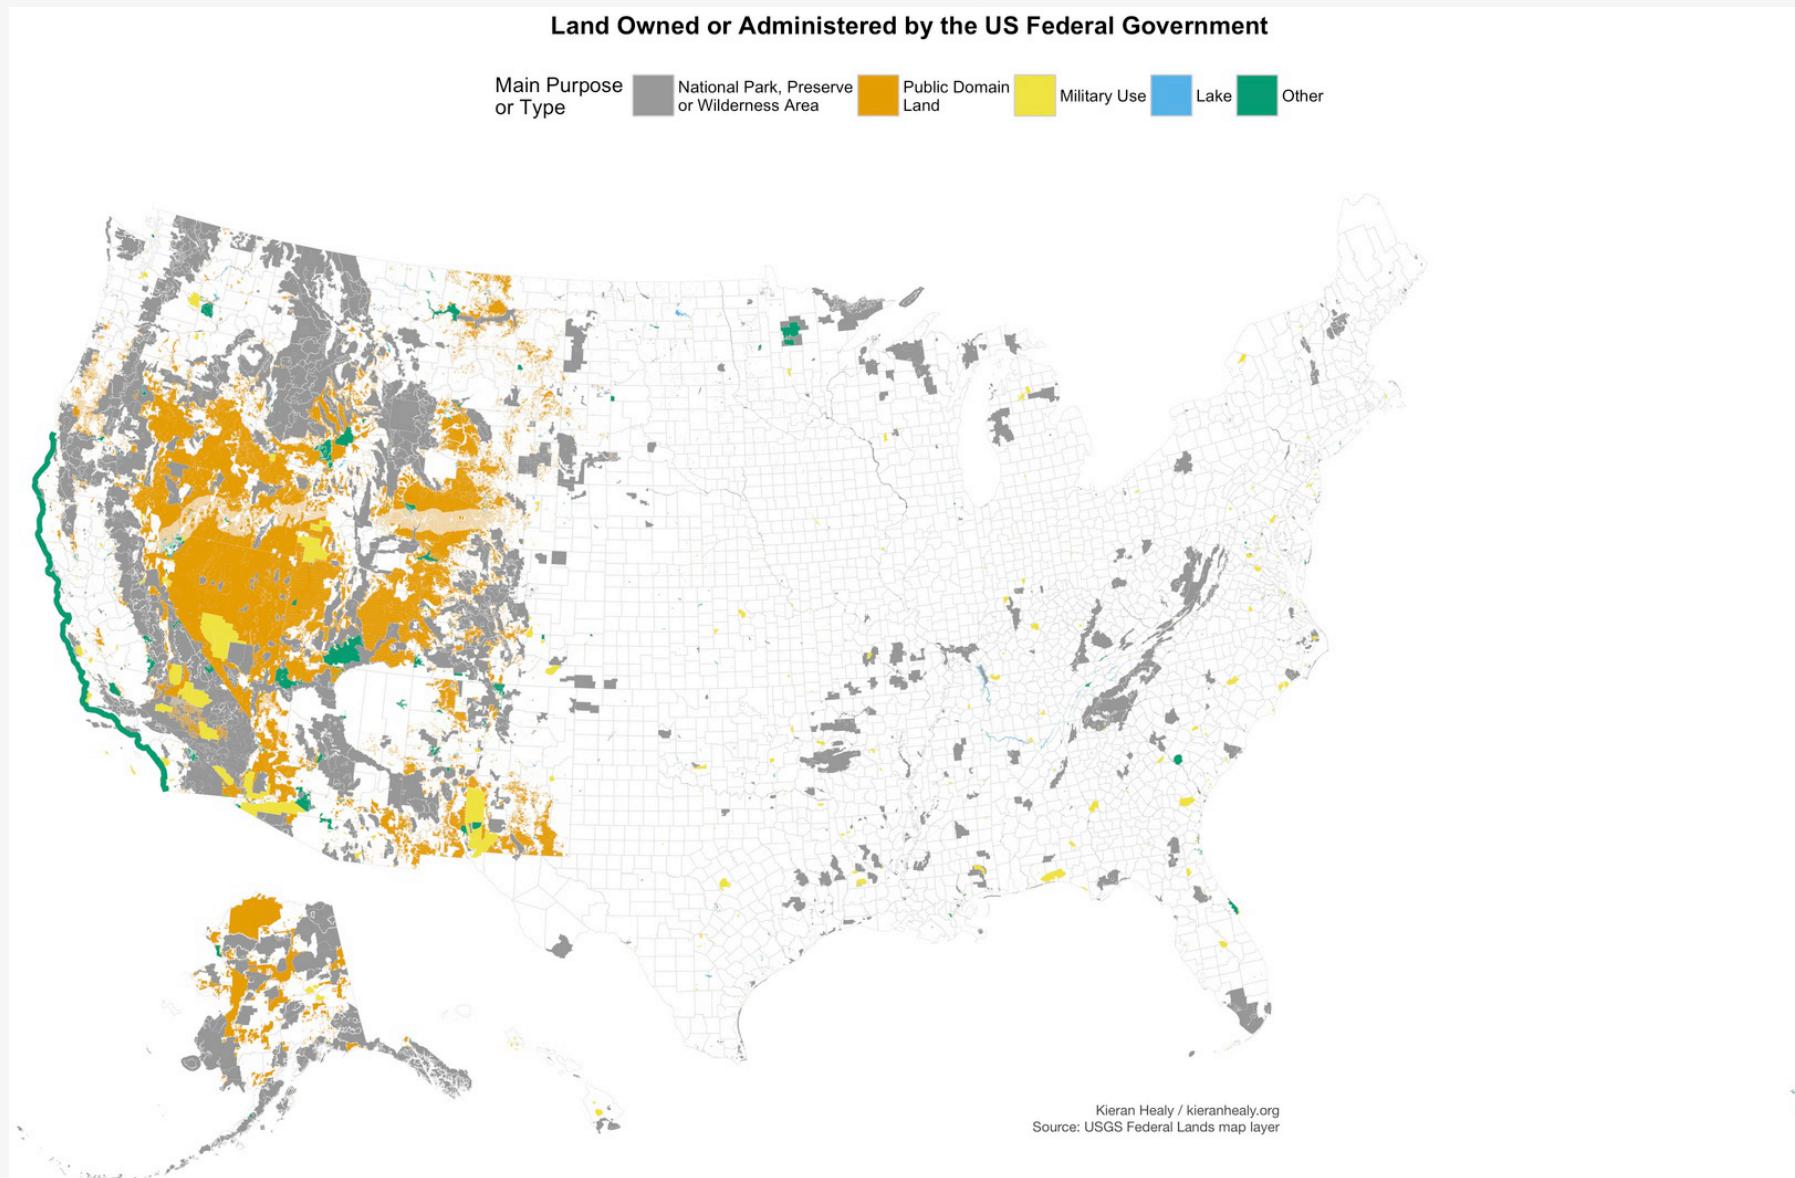

County level vote share; purple midpoint; county area deformed in proportion to population. By Mark Newman

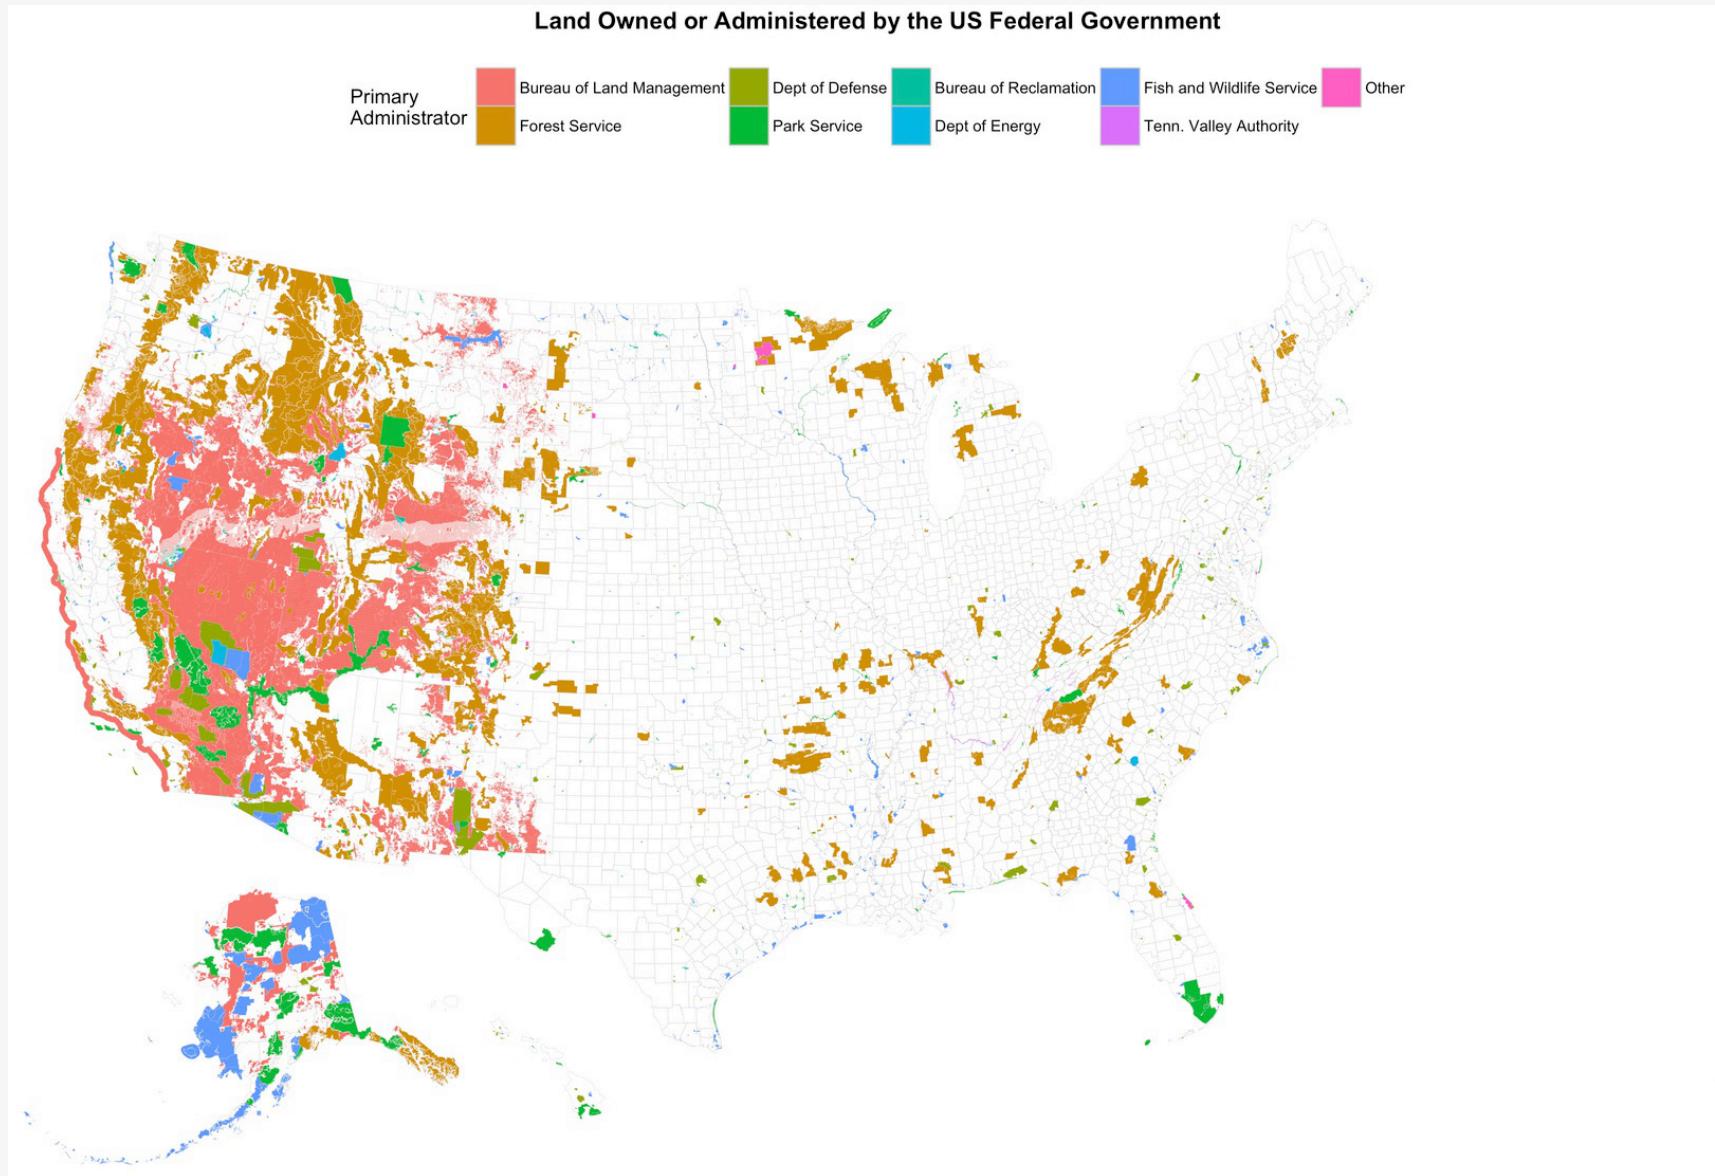

2016 Electoral Vote

Electoral college cartogram (NYT)

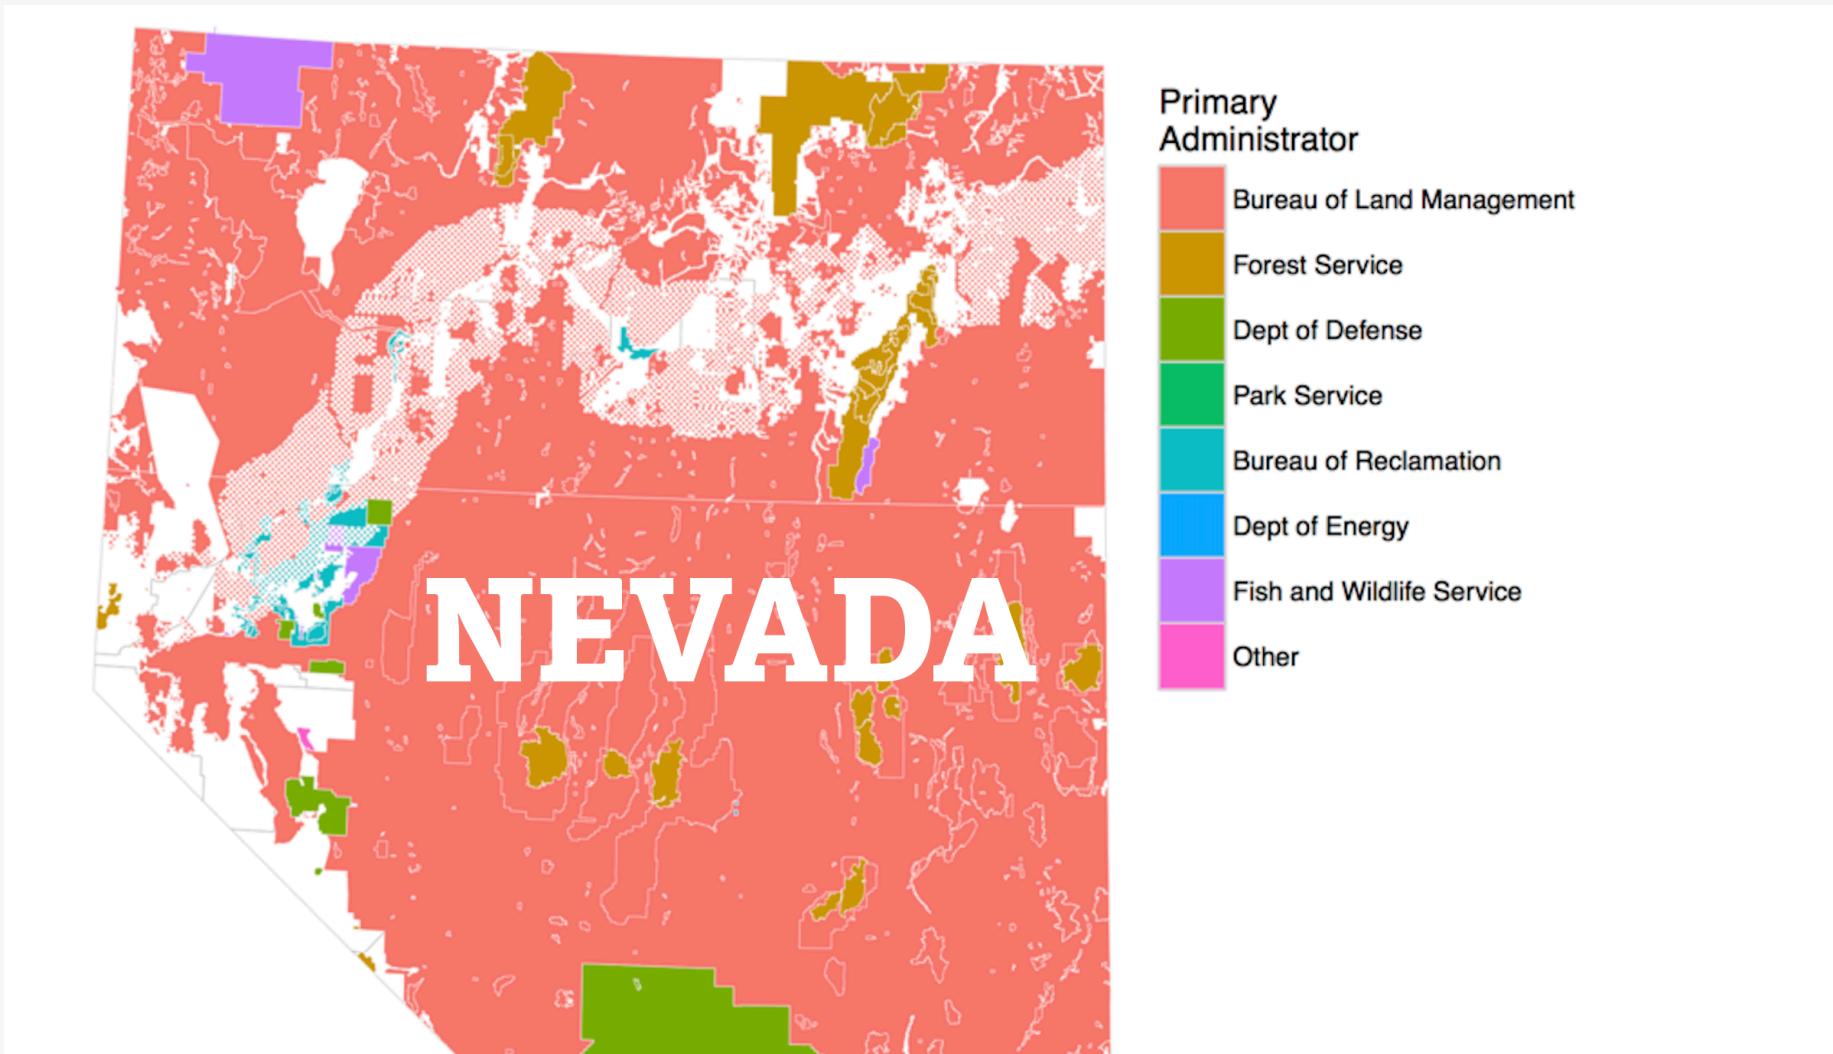

Pretty, Big, and Pretty Empty

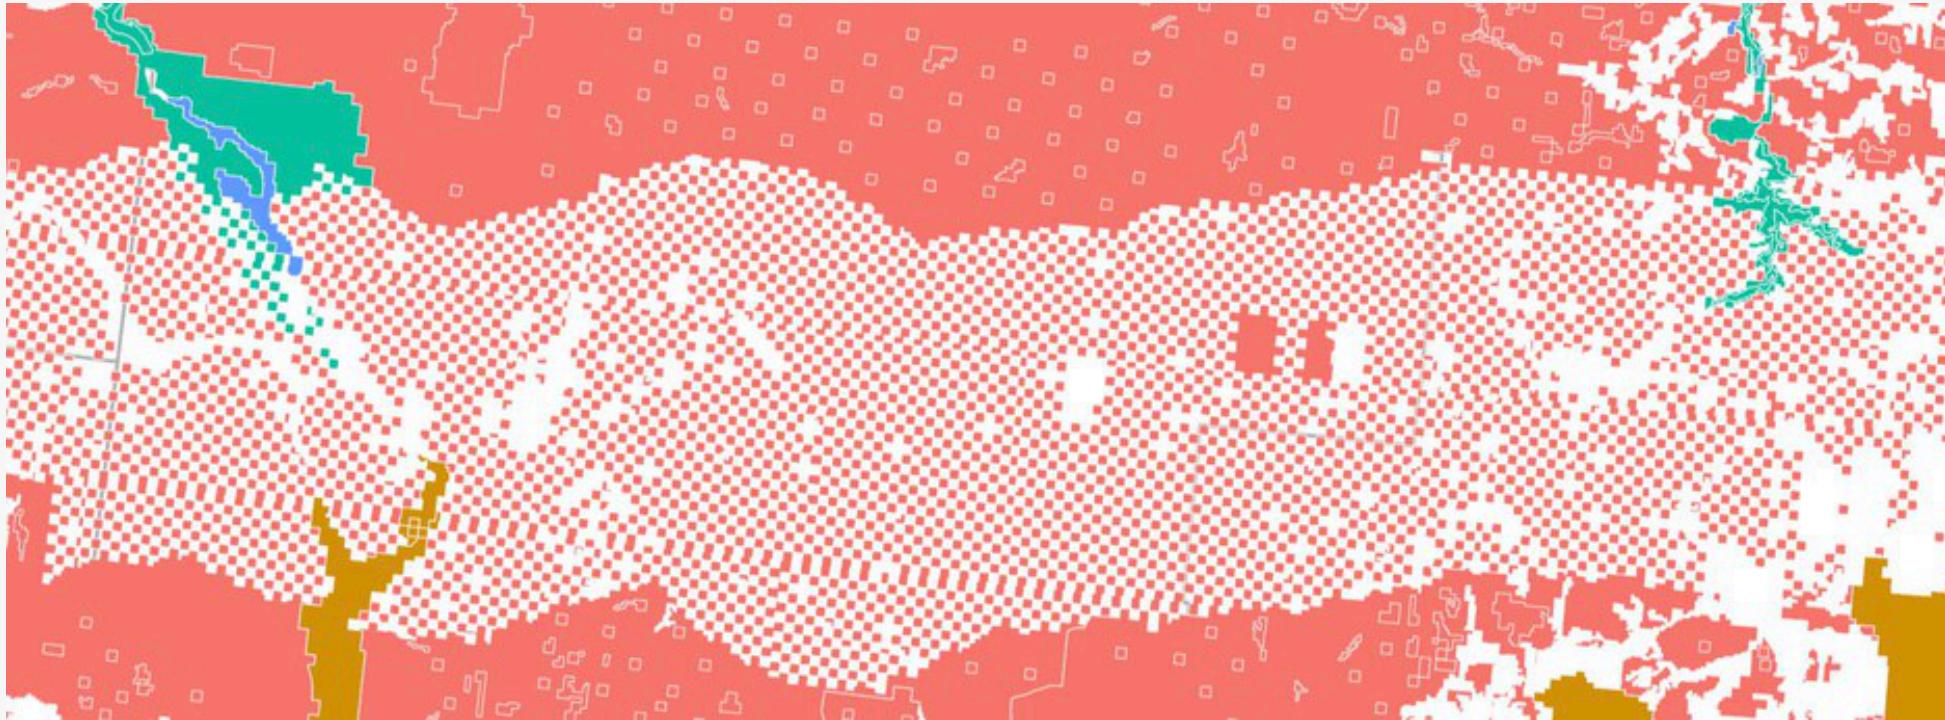

Pretty, Big, and Pretty Empty

Aside: What the hell's that?

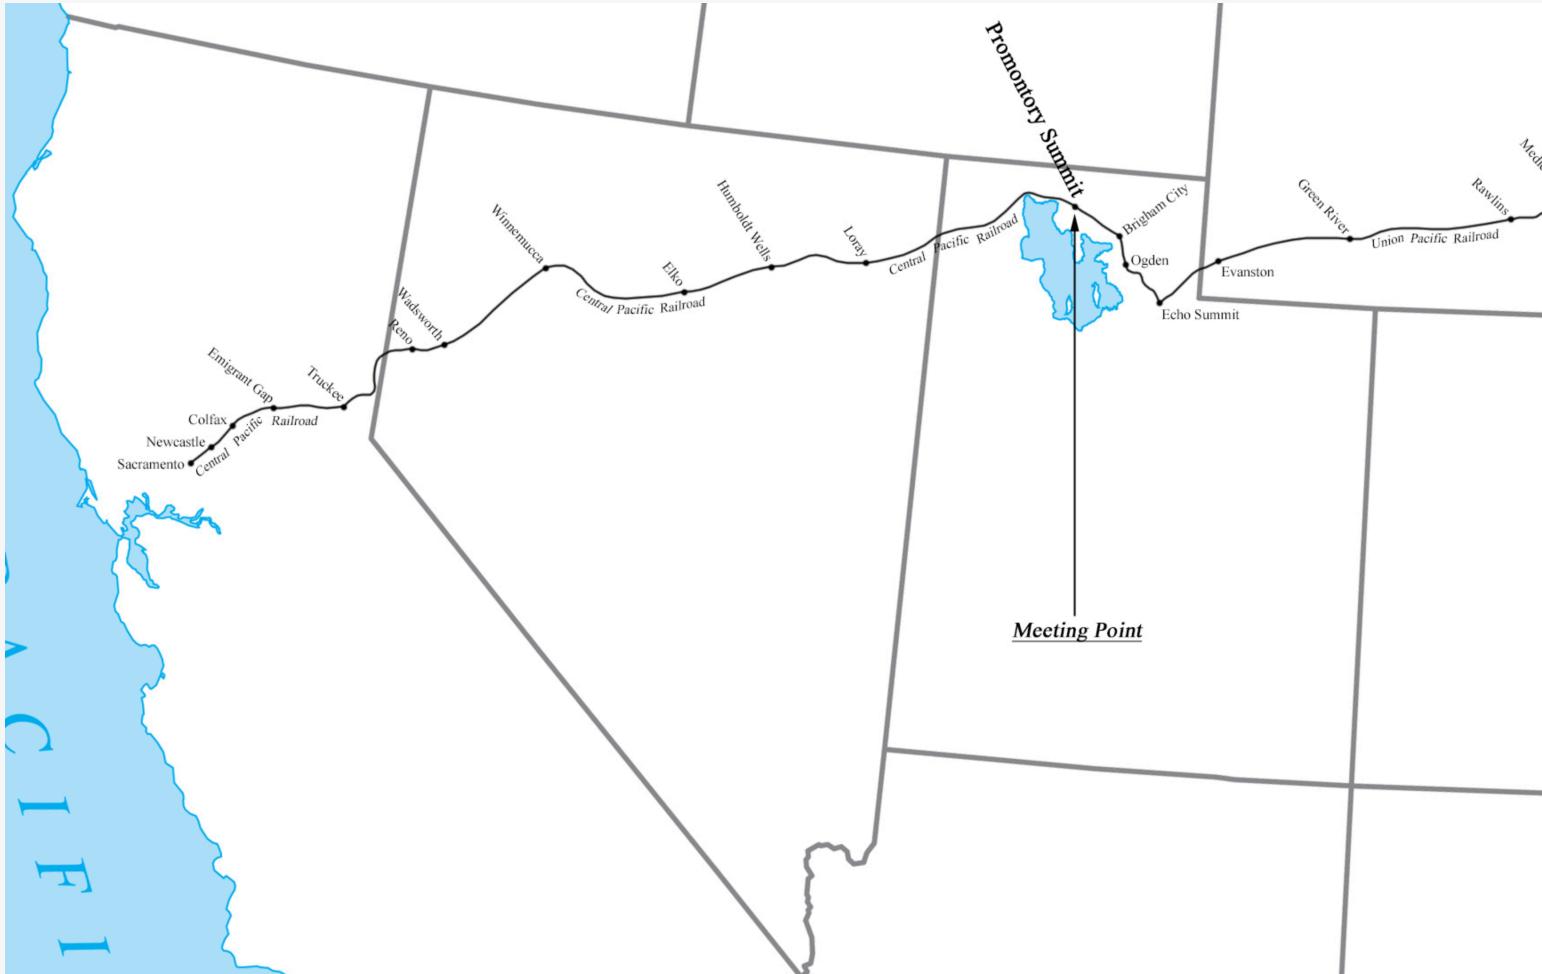

Zoom and Enhance

Surprisingly, not a coding error on my part.

It's the Transcontinental Railroad

Making its way through the [Great Basin](#), America's largest [endorheic watershed](#). The checkerboard is a deliberate assignation of property rights along the borders of the railway line.

Still with us, too

Not identical, as Interstate 80 was able to go through some parts the railroad had to go around. OK, now back to scheduled programming.

Maps as polygons

Packages

```
library(here)      # manage file paths
library(socviz)    # data and some useful functions
library(tidyverse) # your friend and mine
library(maps)      # Some basic maps
library(ggforce)   # ggplot extensions
```

Take a look at this data

```
## This is from the map library  
# library(maps)
```

```
us_states ← map_data("state")
```

```
dim(us_states)
```

```
[1] 15537      6
```

```
## Making it a tibble prevents crashes  
## in the slide rendering later on  
us_states ← as_tibble(us_states)
```

```
us_states
```

```
# A tibble: 15,537 × 6  
  long     lat group order region subregion  
  <dbl>   <dbl> <dbl> <int> <chr>   <chr>  
1 -87.5   30.4     1     1 alabama <NA>

10 -87.8 30.3     1    10 alabama <NA>
# i 15,527 more rows
```

It's a series of rows defining `x` and `y` coordinates on a plane.

If we join those points up as lines while respecting their `group` (i.e. so `ggplot` knows when to “lift the pen”, as with the `gapminder` line plot), we will get an outline map of states in the U.S.

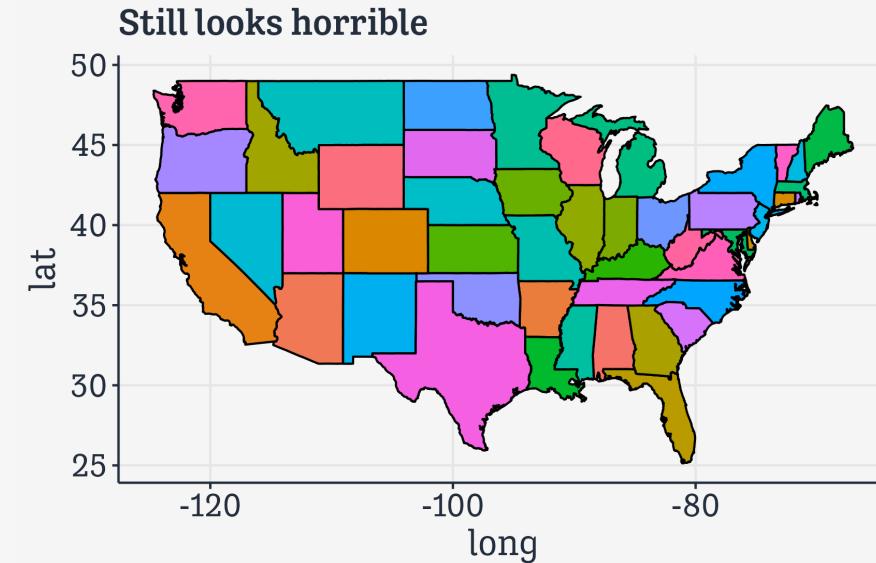

Like this, with `geom_polygon()`

```
us_states %>  
  ggplot(mapping = aes(x = long,  
                        y = lat,  
                        group = group)) +  
  geom_polygon(fill = "white",  
               color = "black") +  
  labs(title = "This looks horrible")
```

We can show a **fill**, too, like any geom

```
us_states %>%
  ggplot(mapping = aes(x = long,
                        y = lat,
                        fill = region,
                        group = group)) +
  geom_polygon(color = "black") +
  guides(fill = "none") +
  labs(title = "Still looks horrible",
       caption = "Set fill = none
                  to stop ggplot from
                  producing a key
                  with 50 entries")
```

We need to do two things

- 1: Fix the map projection
- 2: Add some data to fill with.

For now, we'll do it the direct way

To make explicit what's happening, and to emphasize how *it's all just points and lines made from tables* we'll first do it at the level of the `ggplot` grammar with a geom that just draws shapes, `geom_polygon()`. After that, we'll introduce a new package, `sf` and a new geom, `geom_sf()` that will handle this for us, and more.

Fix the projection

```
us_states ← as_tibble(map_data("state"))
```

Fix the projection

```
us_states ← as_tibble(map_data("state"))

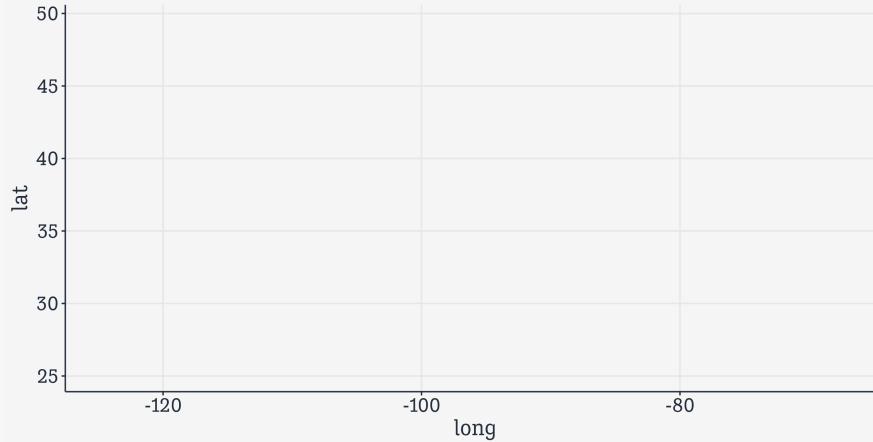

us_states
```

```
# A tibble: 15,537 × 6
  long    lat group order region subregion
  <dbl> <dbl> <dbl> <int> <chr>   <chr>
1 -87.5  30.4     1     1 alabama <NA>
2 -87.5  30.4     1     2 alabama <NA>
3 -87.5  30.4     1     3 alabama <NA>
4 -87.5  30.3     1     4 alabama <NA>
5 -87.6  30.3     1     5 alabama <NA>
6 -87.6  30.3     1     6 alabama <NA>
7 -87.6  30.3     1     7 alabama <NA>
8 -87.6  30.3     1     8 alabama <NA>
9 -87.7  30.3     1     9 alabama <NA>
10 -87.8 30.3     1    10 alabama <NA>
# i 15,527 more rows
```

Fix the projection

```
us_states ← as_tibble(map_data("state"))

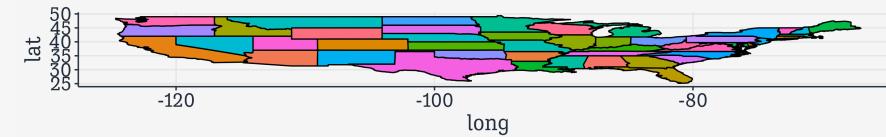

us_states >
  ggplot(mapping = aes(x = long,
                        y = lat,
                        fill = region,
                        group = group))
```

Fix the projection

```
us_states <- as_tibble(map_data("state"))

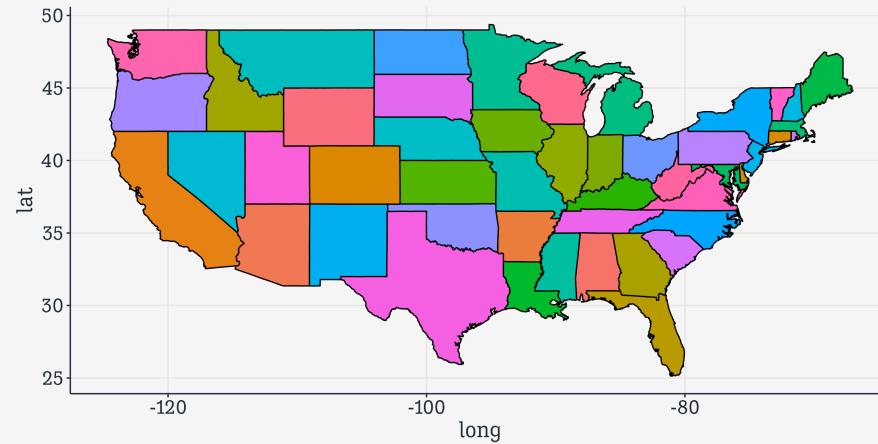

us_states >
  ggplot(mapping = aes(x = long,
                        y = lat,
                        fill = region,
                        group = group)) +
  geom_polygon(color = "black")
```

Fix the projection

```
us_states <- as_tibble(map_data("state"))

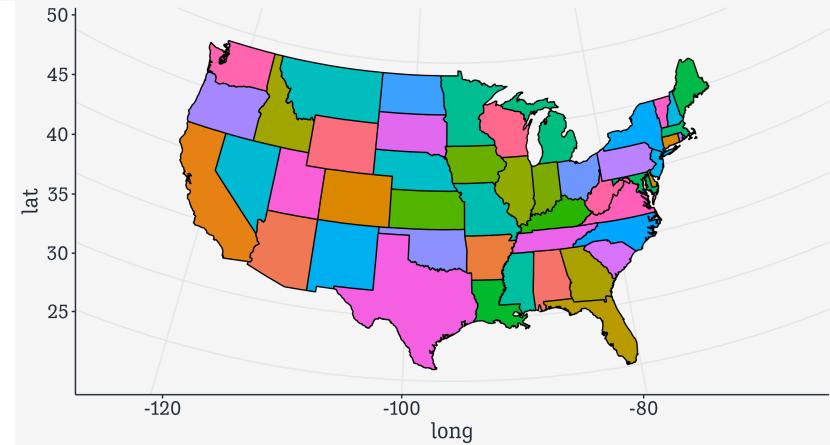

us_states %>
  ggplot(mapping = aes(x = long,
                        y = lat,
                        fill = region,
                        group = group)) +
  geom_polygon(color = "black") +
  guides(fill = "none")
```

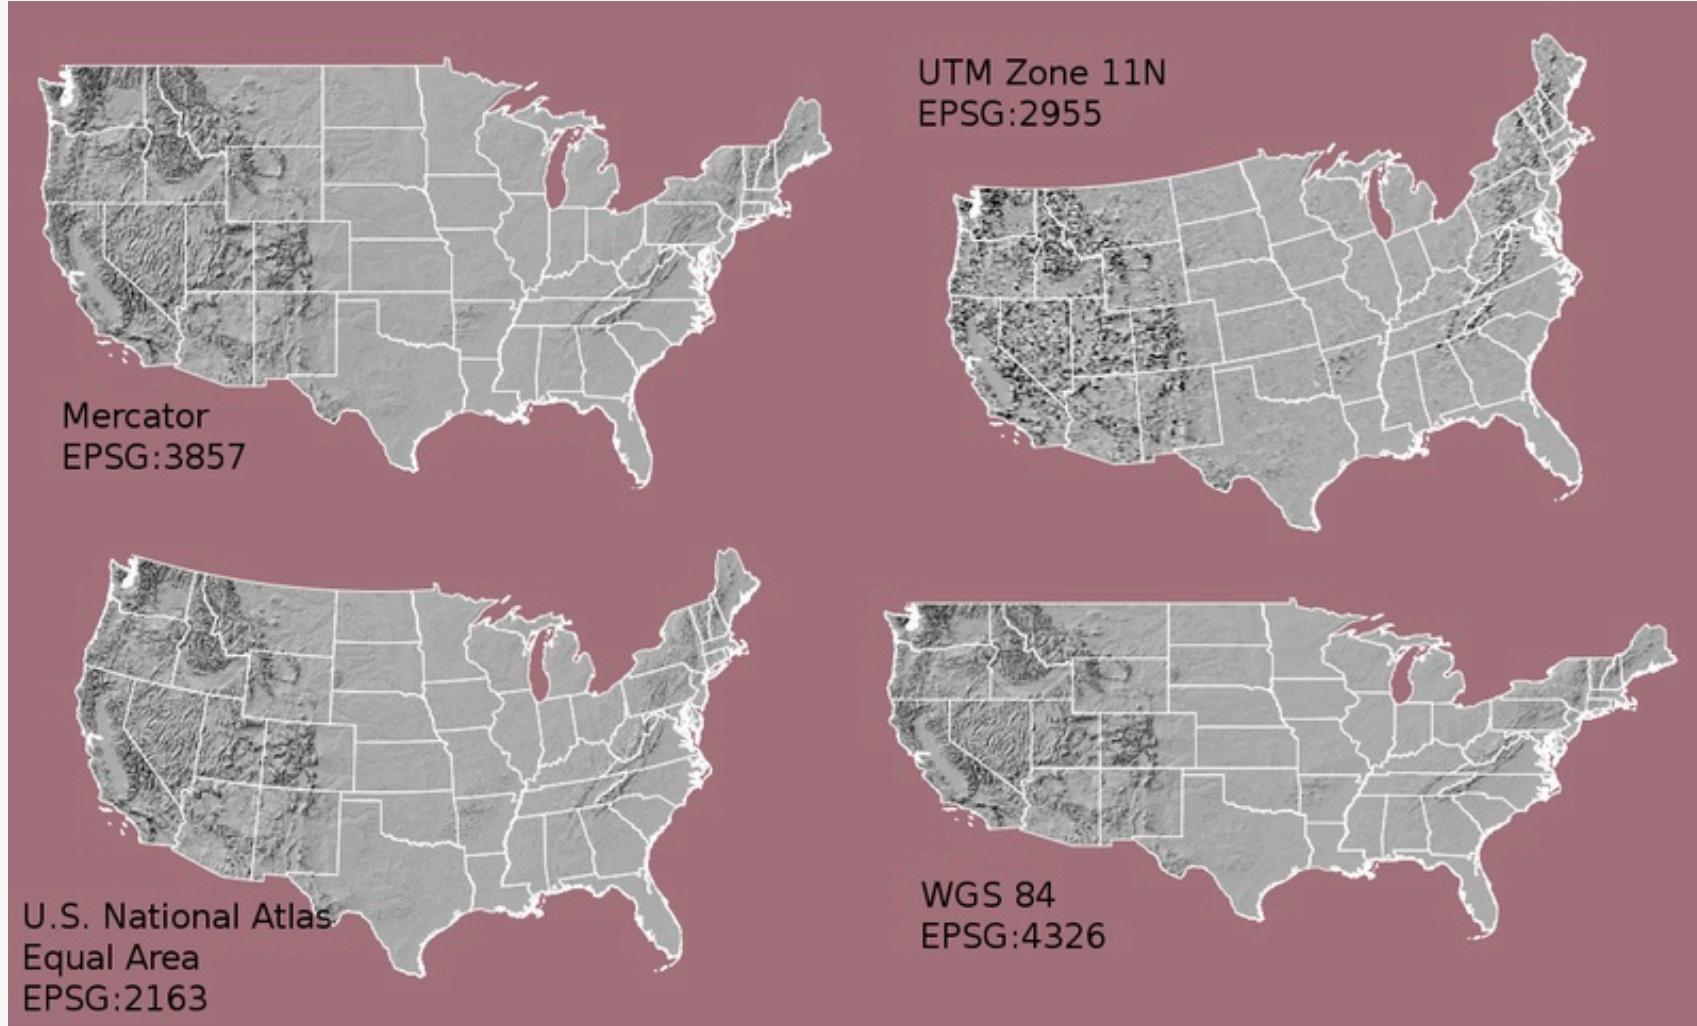

Fix the projection

```
us_states <- as_tibble(map_data("state"))

us_states %>
  ggplot(mapping = aes(x = long,
                        y = lat,
                        fill = region,
                        group = group)) +
  geom_polygon(color = "black") +
  guides(fill = "none") +
  coord_map(projection = "albers",
            lat0 = 39,
            lat1 = 45)
```

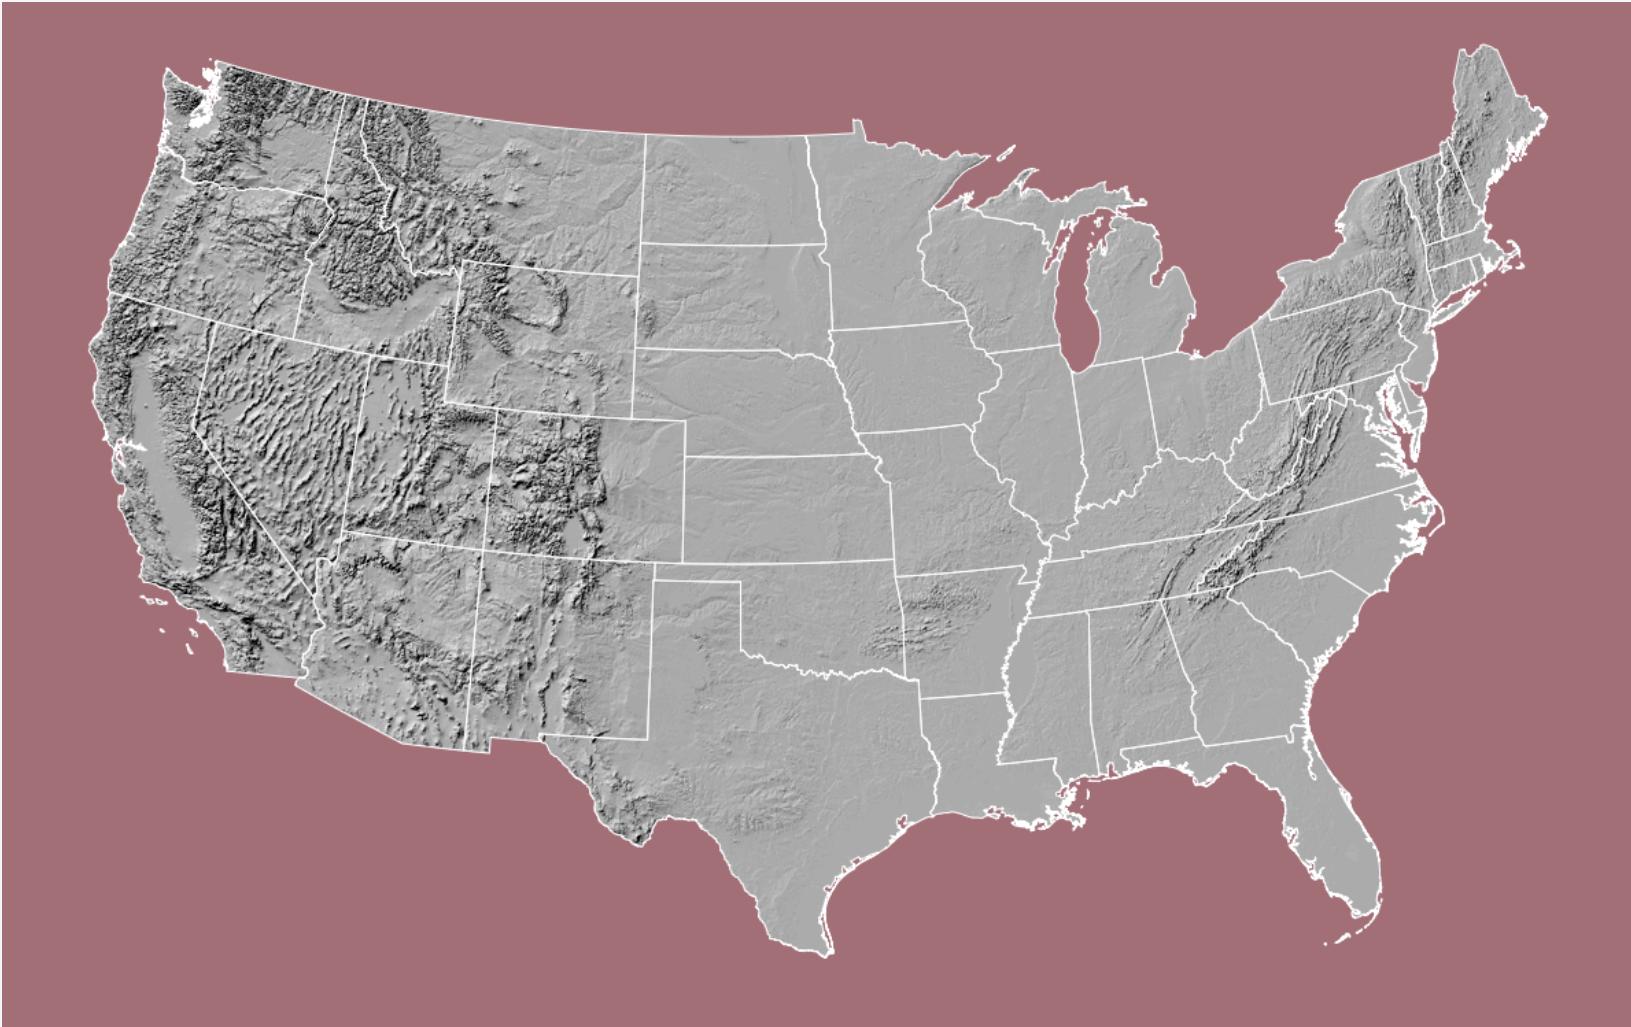

U.S. Map Projections

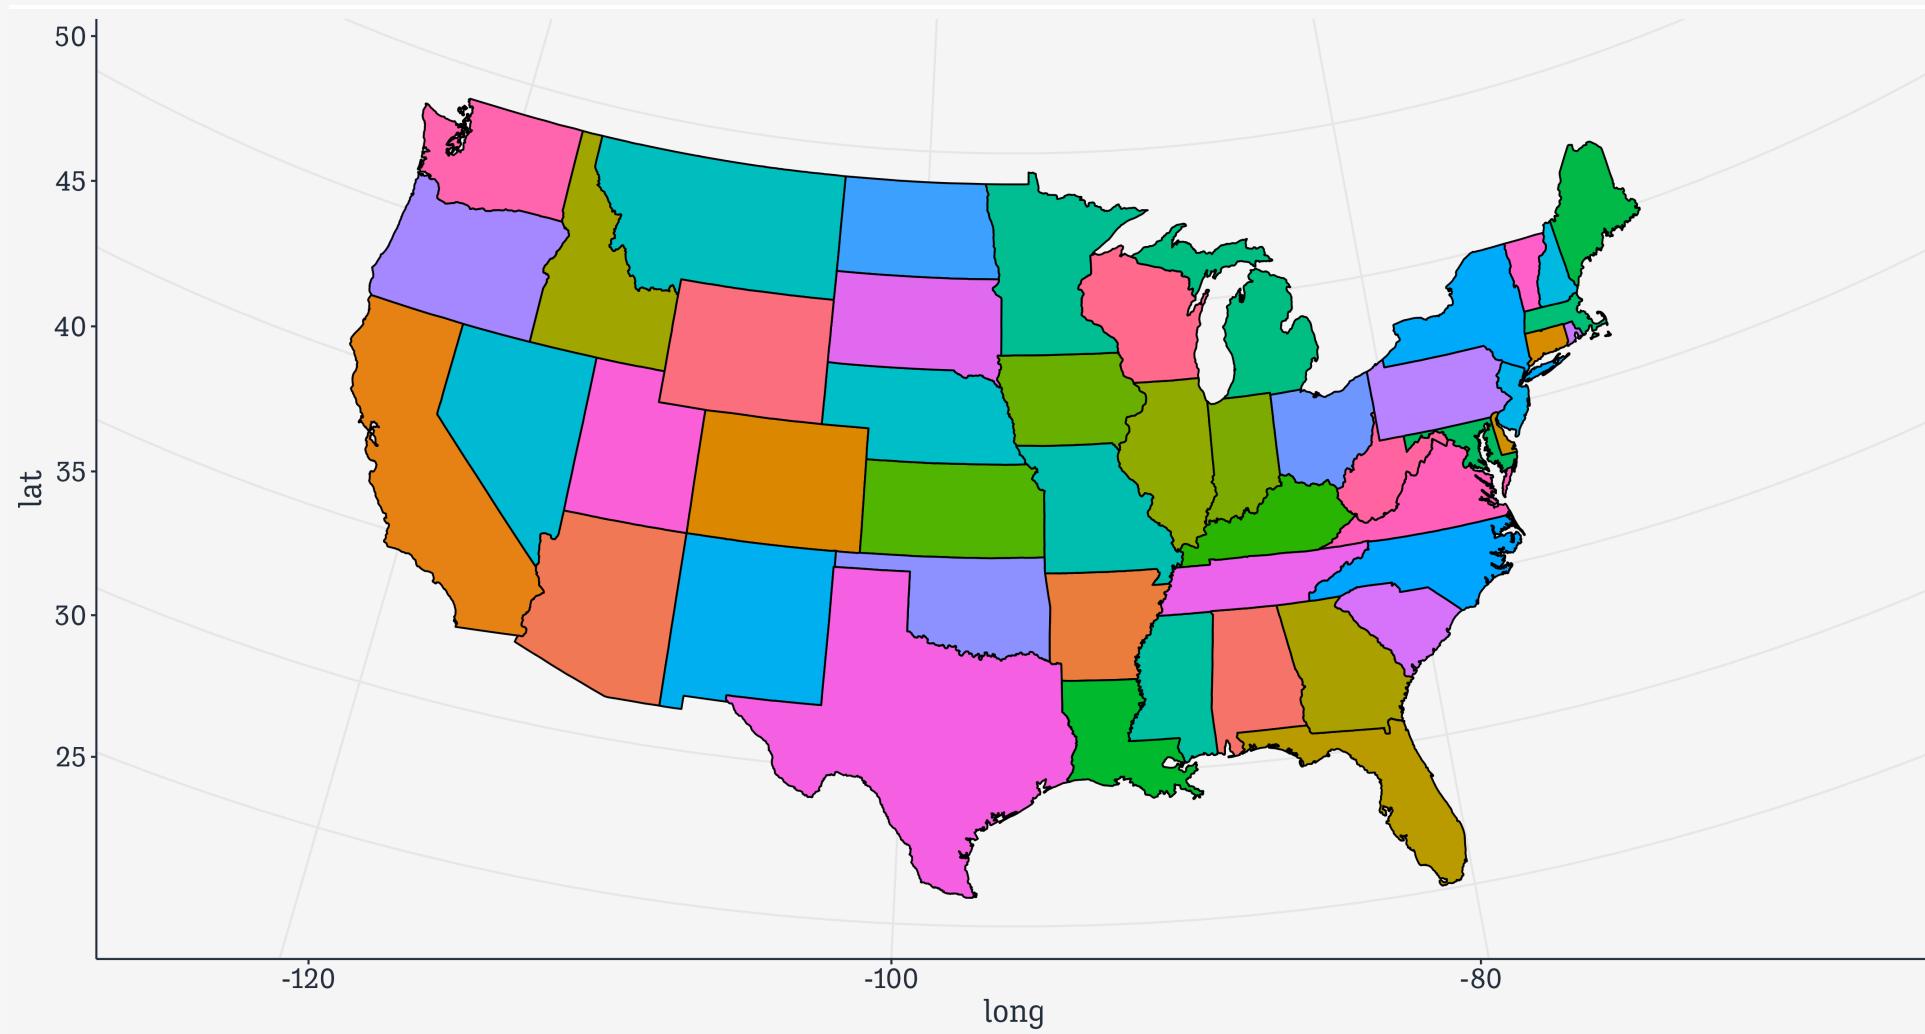

A selection of projections

U.S. Map Projections

Albers is the standard

Our U.S. Map again, now transformed

Next, some data

We can merge our state-level `election` data with the `us_states` table, but we need to do a little work.

us_states

```
# A tibble: 15,537 × 6
  long    lat group order region subregion
  <dbl> <dbl> <dbl> <int> <chr>   <chr>
1 -87.5 30.4     1     1 alabama <NA>
2 -87.5 30.4     1     2 alabama <NA>
3 -87.5 30.4     1     3 alabama <NA>
4 -87.5 30.3     1     4 alabama <NA>
5 -87.6 30.3     1     5 alabama <NA>
6 -87.6 30.3     1     6 alabama <NA>
7 -87.6 30.3     1     7 alabama <NA>
8 -87.6 30.3     1     8 alabama <NA>
9 -87.7 30.3     1     9 alabama <NA>
10 -87.8 30.3    1    10 alabama <NA>
# i 15,527 more rows
```

election

```
# A tibble: 51 × 22
  state      st     fips total_vote vote_margin
  <chr>     <chr> <dbl>      <dbl>       <dbl>
  winner    party   pct_margin r_points
  <chr>     <chr> <dbl>      <dbl>       <dbl>
  1 Alabama  AL        1  2123372      588708
  Trump    Repu...  0.277     27.7
  2 Alaska   AK        2  318608       46933
  Trump    Repu...  0.147     14.7
  3 Arizona  AZ        4  2604657      91234

# i 41 more rows
```

This is a *left join*

```
us_states_elec ← left_join(us_states, election, by = "region")

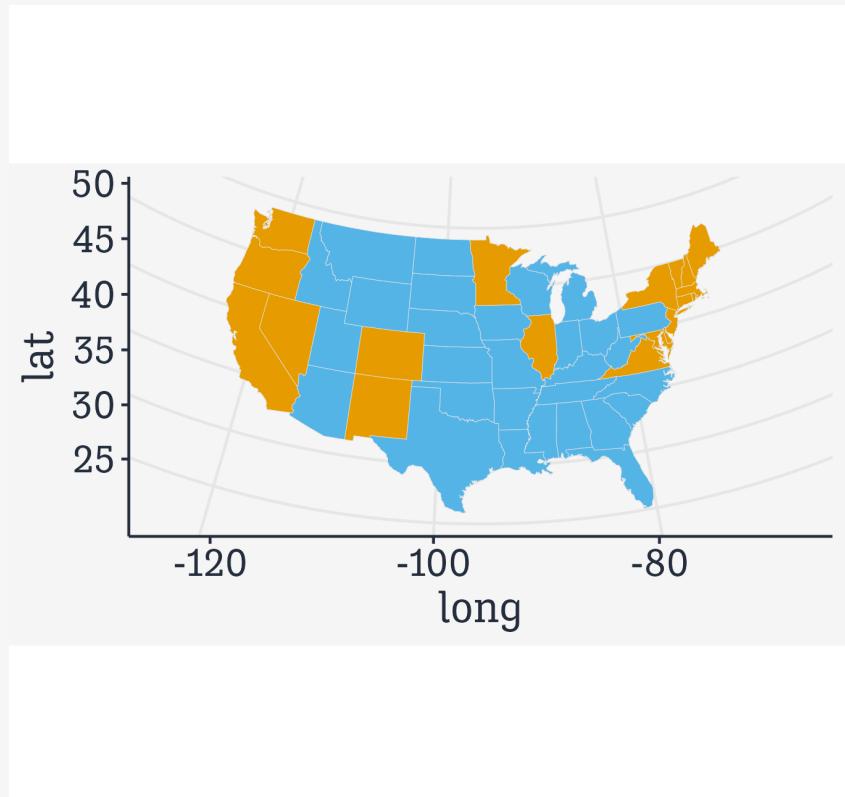

us_states_elec

# A tibble: 15,537 × 28
  long     lat group order region subregion state    st     fips total_vote
  <dbl>   <dbl> <dbl> <int> <chr>   <chr>    <chr>   <chr> <dbl>      <dbl>
1 -87.5  30.4     1     1 alabama <NA>    Alabama AL      1  2123372
2 -87.5  30.4     1     2 alabama <NA>    Alabama AL      1  2123372
3 -87.5  30.4     1     3 alabama <NA>    Alabama AL      1  2123372
4 -87.5  30.3     1     4 alabama <NA>    Alabama AL      1  2123372
5 -87.6  30.3     1     5 alabama <NA>    Alabama AL      1  2123372
6 -87.6  30.3     1     6 alabama <NA>    Alabama AL      1  2123372
7 -87.6  30.3     1     7 alabama <NA>    Alabama AL      1  2123372
8 -87.6  30.3     1     8 alabama <NA>    Alabama AL      1  2123372
9 -87.7  30.3     1     9 alabama <NA>    Alabama AL      1  2123372
10 -87.8 30.3     1    10 alabama <NA>   Alabama AL      1  2123372
# i 15,527 more rows
# i 18 more variables: vote_margin <dbl>, winner <chr>, party <chr>,
#   pct_margin <dbl>, r_points <dbl>, d_points <dbl>, pct_clinton <dbl>,
#   pct_trump <dbl>, pct_johnson <dbl>, pct_other <dbl>, clinton_vote <dbl>,
#   trump_vote <dbl>, johnson_vote <dbl>, other_vote <dbl>, ev_dem <dbl>,
#   ev_rep <dbl>, ev_oth <dbl>, census <chr>
```

Now our `us_states_elec` table has both the line-drawing information and (very redundantly) the election data merged in, with rows repeated as necessary.

Choropleths

```
us_states_elec >  
  ggplot(mapping = aes(x = long,  
                        y = lat,  
                        fill = party,  
                        group = group)) +  
  geom_polygon(color = "gray90",  
               size = 0.1) +  
  coord_map(projection = "albers",  
            lat0 = 39, lat1 = 45) +  
  guides(fill = "none")
```

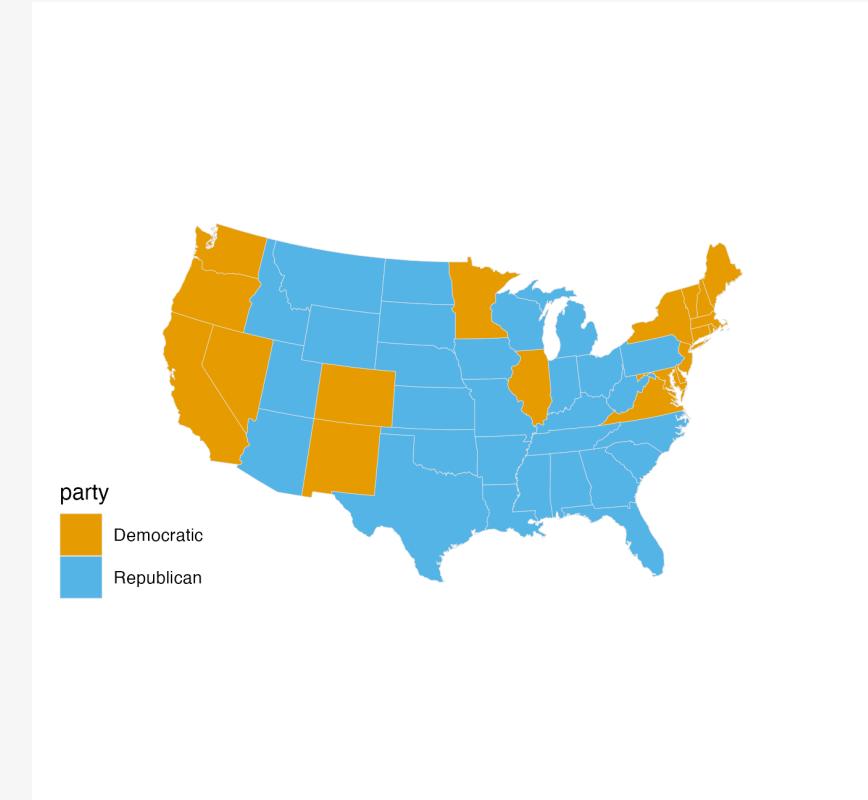

Let's turn off the gridlines

This is a *theme function*.

```
theme_map ← function(base_size=9, base_family="") {  
  require(grid)  
  theme_bw(base_size=base_size, base_family=base_family) %>%replace%  
    theme(axis.line=element_blank(),  
          axis.text=element_blank(),  
          axis.ticks=element_blank(),  
          axis.title=element_blank(),  
          panel.background=element_blank(),  
          panel.border=element_blank(),  
          panel.grid=element_blank(),  
          panel.spacing=unit(0, "lines"),  
          plot.background=element_blank(),  
          legend.justification = c(0,0),  
          legend.position = c(0,0)  
    )  
}
```

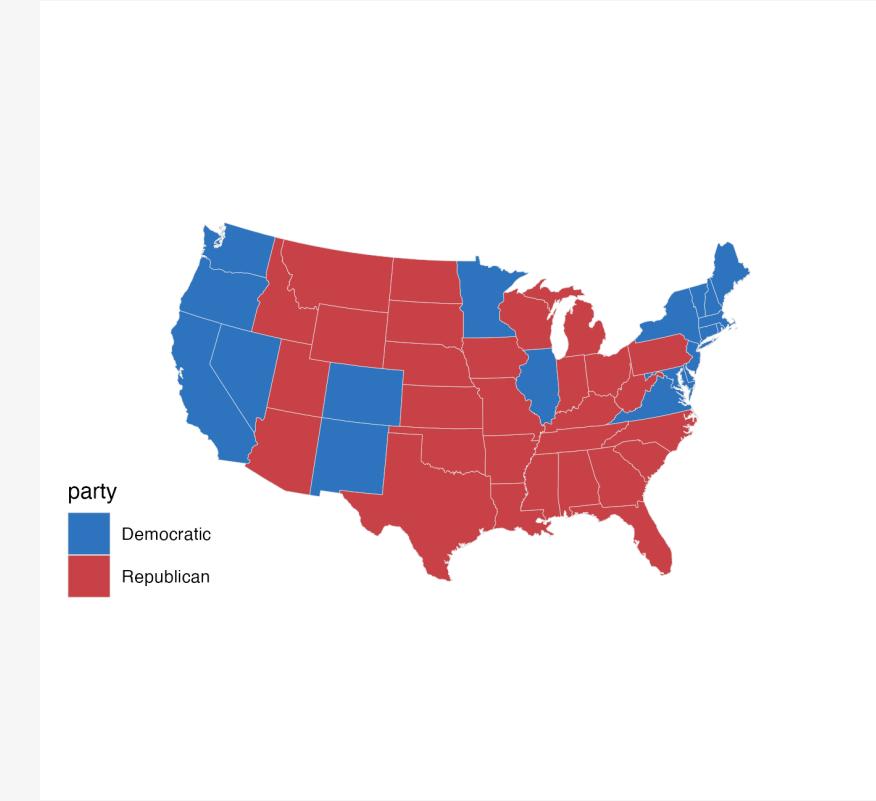

Add the theme function at the end

```
us_states_elec >
  ggplot(mapping = aes(x = long,
                        y = lat,
                        fill = party,
                        group = group)) +
  geom_polygon(color = "gray90",
               size = 0.1) +
  coord_map(projection = "albers",
            lat0 = 39, lat1 = 45) +
  theme_map()
```

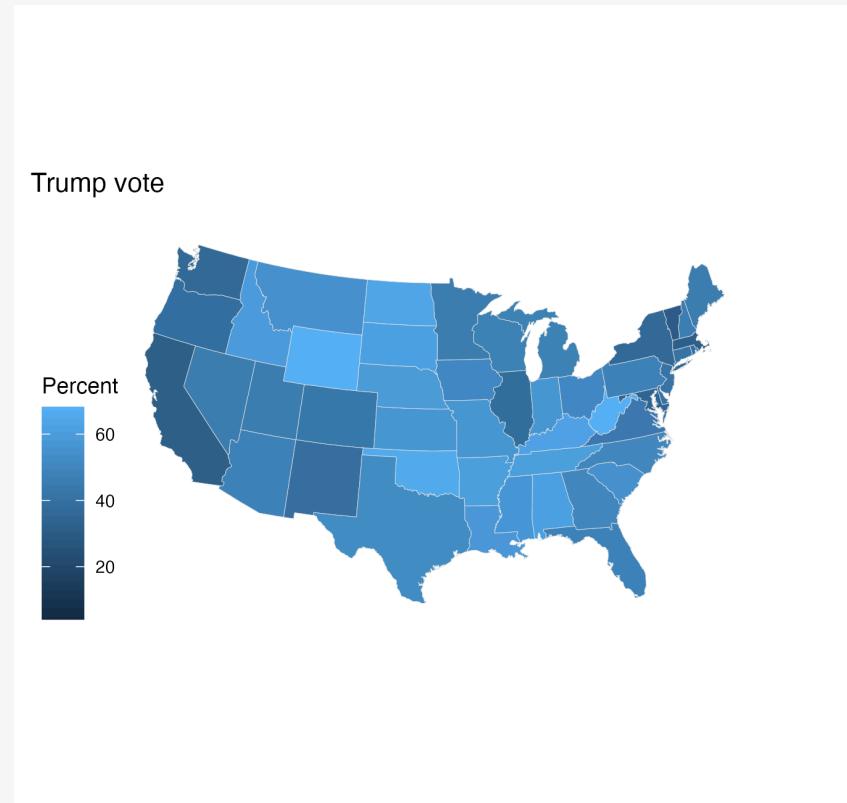

Fix the Party Colors

```
## Hex color codes for Democratic Blue and Repu  
party_colors <- c("#2E74C0", "#CB454A")  
  
us_states_elec >  
  ggplot(mapping = aes(x = long,  
                        y = lat,  
                        fill = party,  
                        group = group)) +  
  geom_polygon(color = "gray90",  
               size = 0.1) +  
  scale_fill_manual(values = party_colors) +  
  coord_map(projection = "albers",  
            lat0 = 39, lat1 = 45) +  
  theme_map()
```

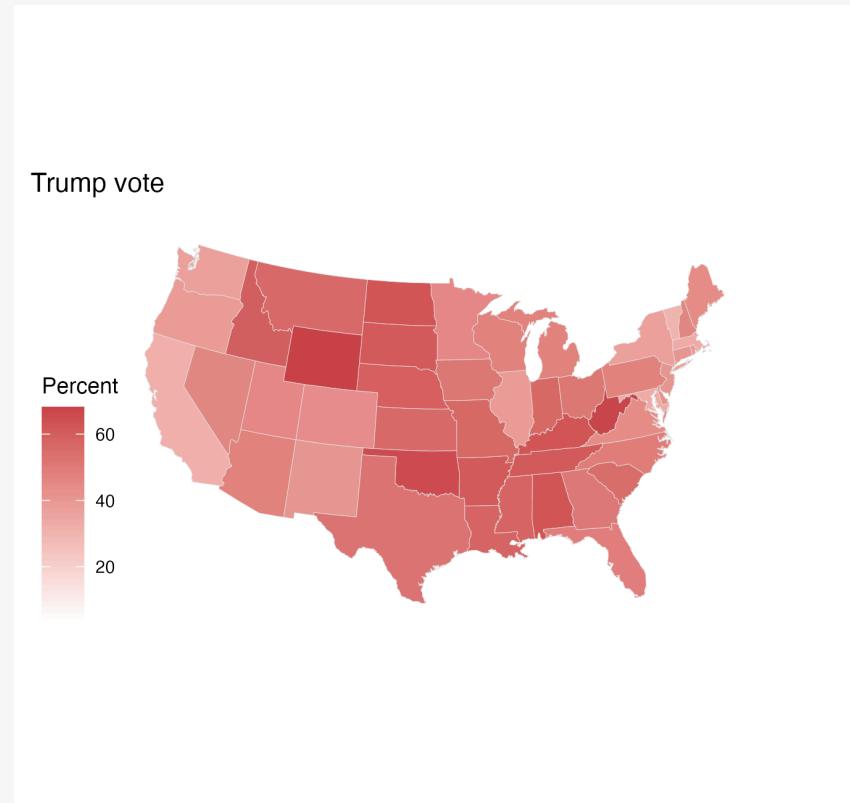

Continuous measures are *gradients*

```
us_states_elec >  
  ggplot(mapping = aes(x = long,  
                        y = lat,  
                        fill = pct_trump,  
                        group = group)) +  
  geom_polygon(color = "gray90",  
               size = 0.1) +  
  coord_map(projection = "albers",  
            lat0 = 39, lat1 = 45) +  
  labs(title = "Trump vote",  
       fill = "Percent") +  
  theme_map()
```

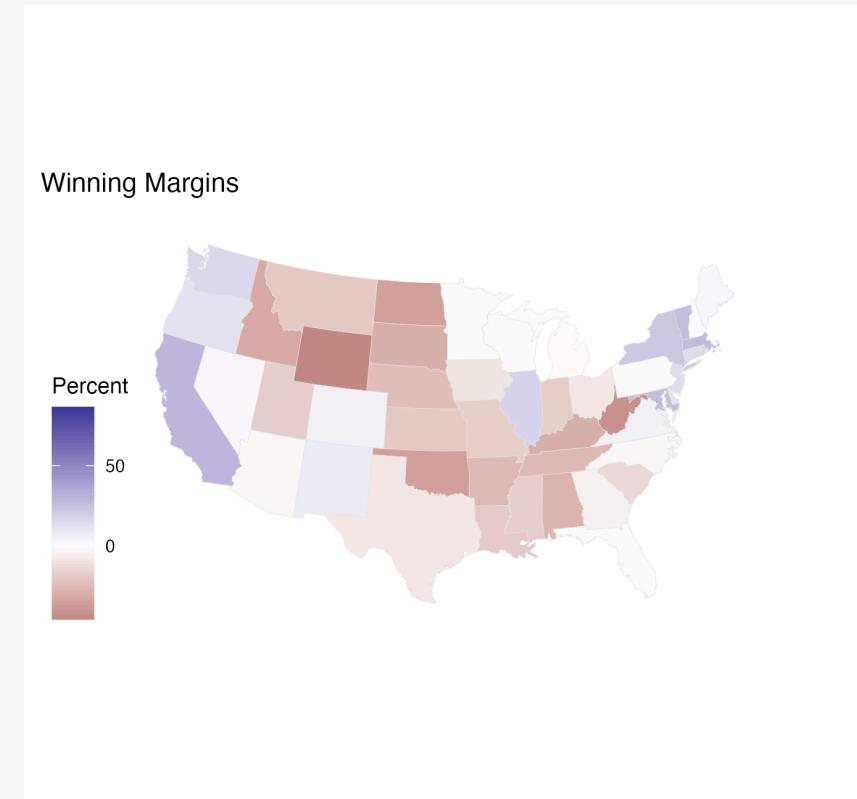

Fix the gradient with a `scale` function

```
us_states_elec >  
  ggplot(mapping = aes(x = long,  
                        y = lat,  
                        fill = pct_trump,  
                        group = group)) +  
  geom_polygon(color = "gray90",  
               size = 0.1) +  
  scale_fill_gradient(low = "white",  
                      high = "#CB454A") +

Percent Black, by County, binned

Big counties, few people, rare events

Example: Reverse coding

Code Reverse

```
orange_pal ← RColorBrewer::brewer.pal(n = 6,  
                                      name = "Oranges")  
orange_pal
```

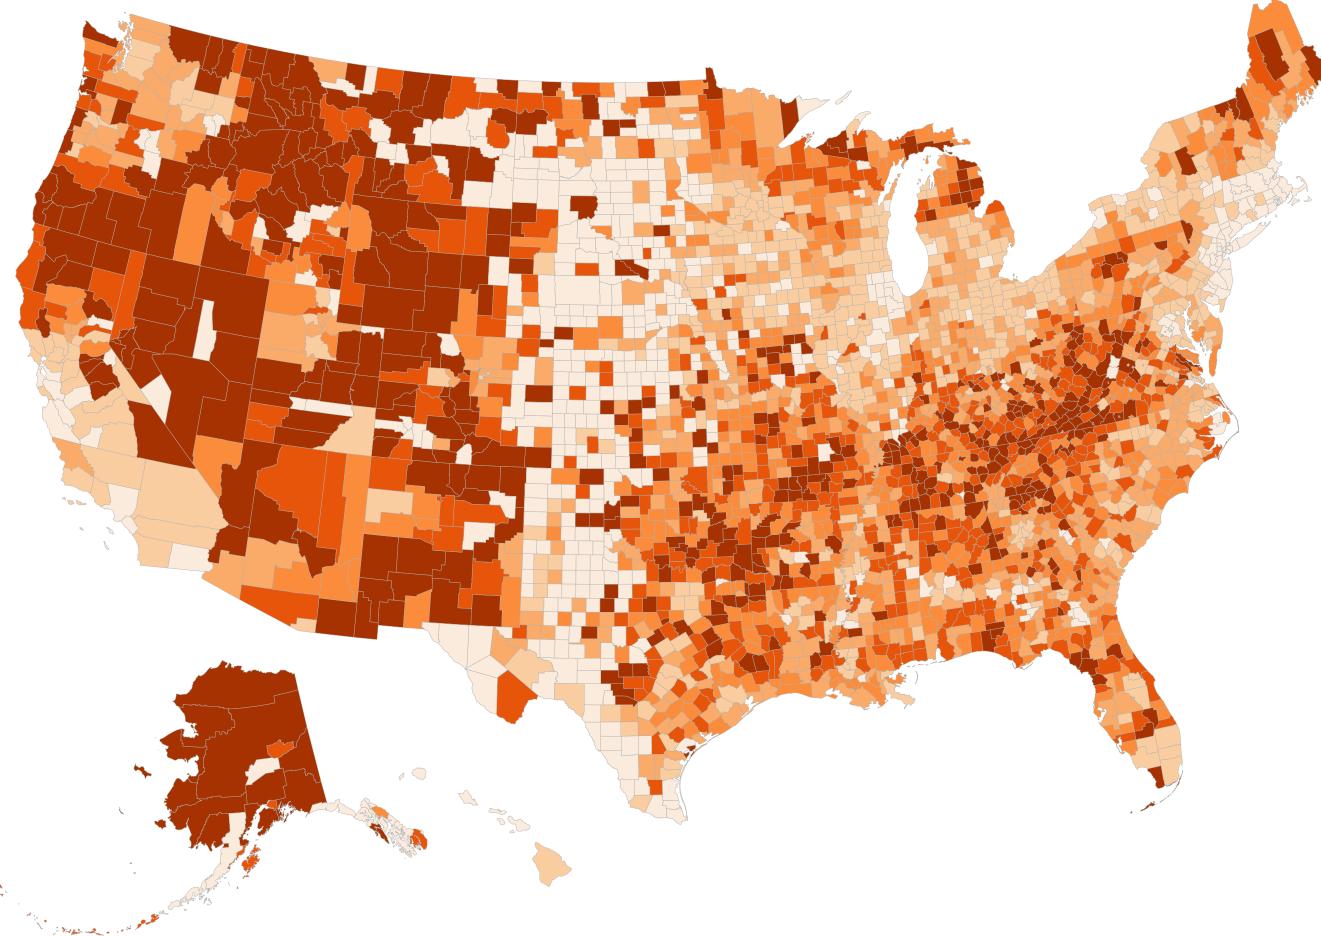

```
[1] "#FEEDDE" "#FDD0A2" "#FDAE6B" "#FD8D3C" "#E6550D" "#A63603"
```

Build a plot

```
p_g1 ← county_full %>  
  ggplot(mapping = aes(x = long, y = lat,  
                      fill = su_gun6,  
                      group = group)) +  
  geom_polygon(color = "gray70",  
               size = 0.1) +  
  coord_fixed() +  
  scale_fill_manual(values = orange_pal) +  
  labs(title = "Gun-Related Suicides, 1999-2015",  
       fill = "Rate per 100,000 pop.") +  
  theme_map() +  
  guides(fill = guide_legend(nrow = 1)) +  
  theme(legend.position = "bottom")
```

Gun-Related Suicides, 1999-2015

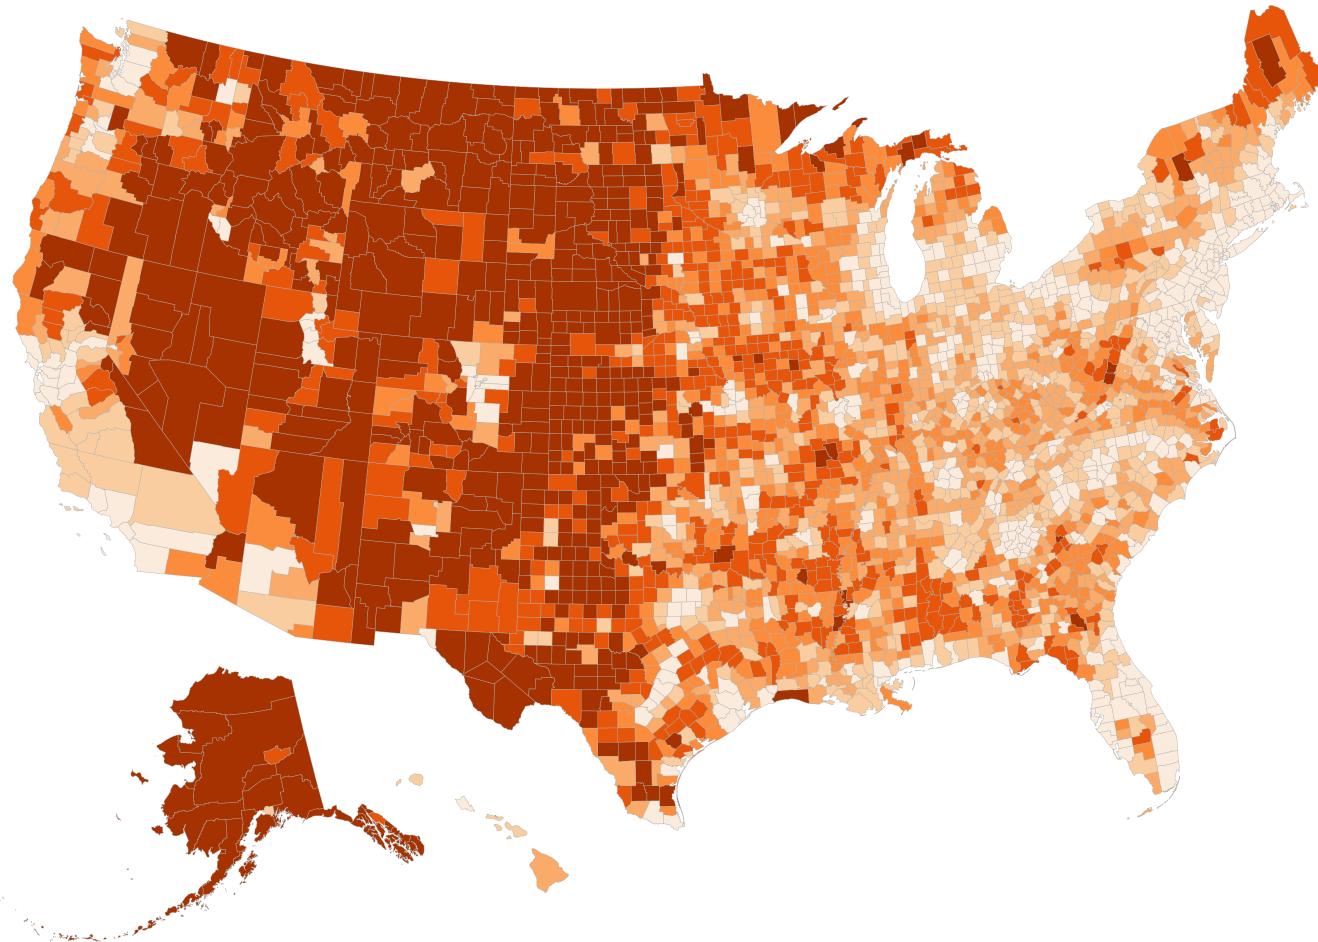

Regular palette

And another

```
p_g2 ← county_full %>  
  ggplot(mapping = aes(x = long, y = lat,  
                      fill = pop_dens6,  
                      group = group)) +  
  geom_polygon(color = "gray70",  
               size = 0.1) +  
  coord_fixed() +  
  scale_fill_manual(values = orange_rev) +  
  labs(title = "Reverse-coded Population Density",  
       fill = "Persons per square mile") +  
  theme_map() +  
  guides(fill = guide_legend(nrow = 1)) +  
  theme(legend.position = "bottom")
```

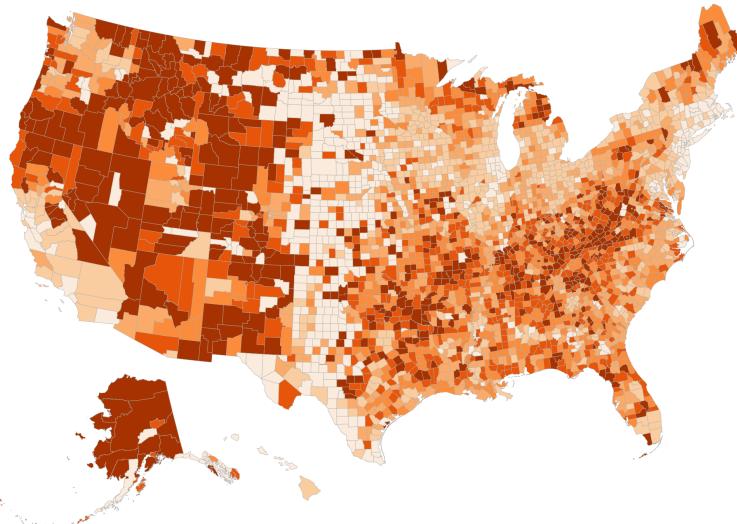

Reverse-coded Population Density

Reverse-coded density

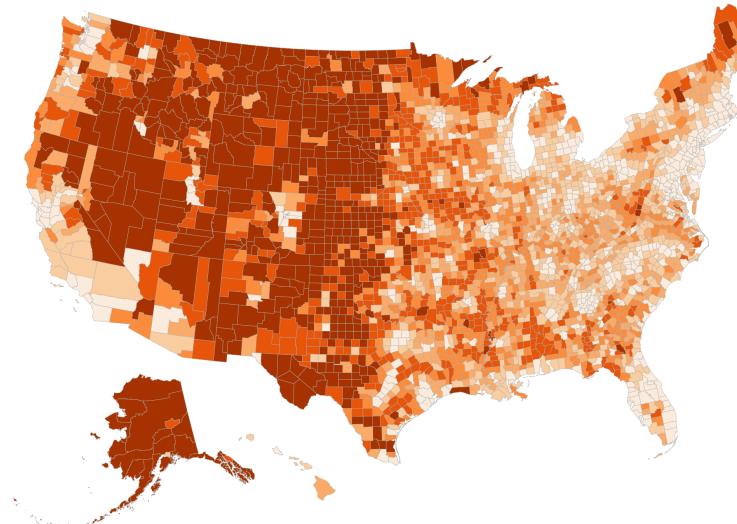

Comparison

Gun-Related Suicides, 1999-2015

Rate per 100,000 pop. [0, 4] [4, 7] [7, 8] [8, 10] [10, 12] [12, 54]

Reverse-coded Population Density

Persons per square mile [0, 9] [9, 25] [25, 45] [45, 82] [82, 215] [215, 71672]

Small multiples for maps

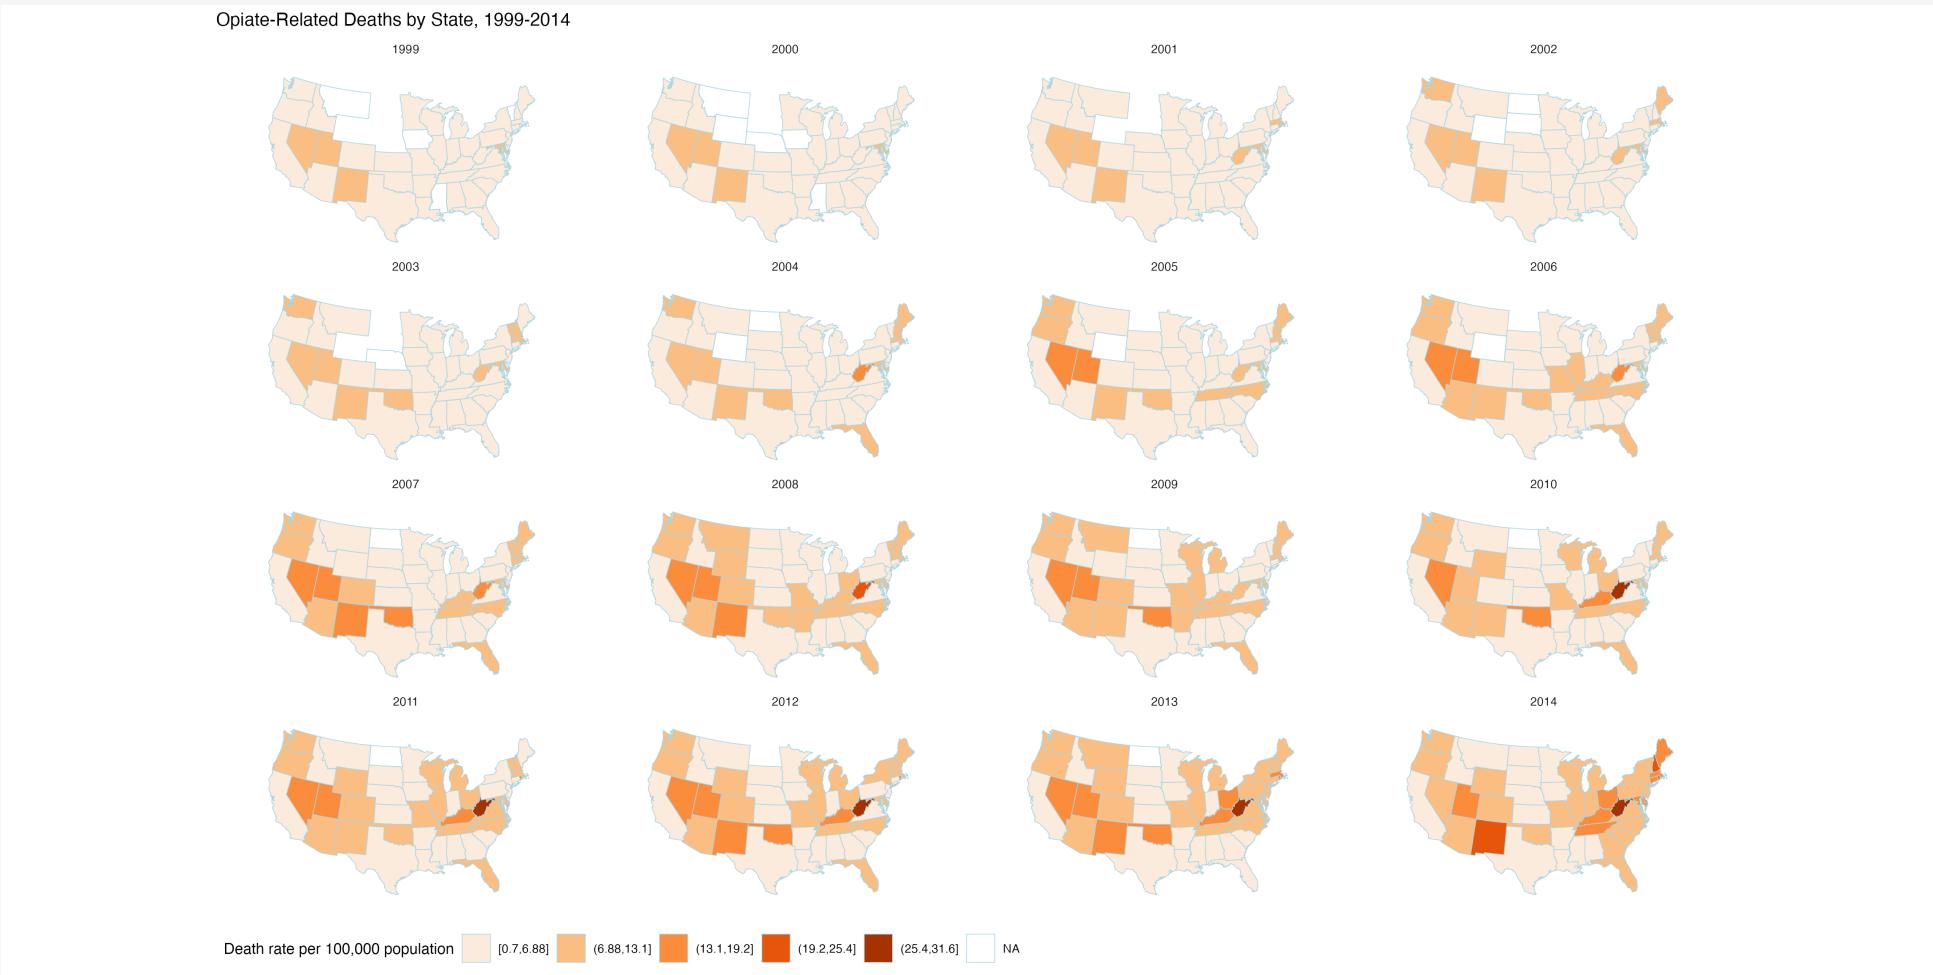

Opiate-related Mortality, 1999-2014
