Nearly done with the scaffolding

- Thought about elements of visualization
- Gotten oriented to R and RStudio
- Knitted a document
- Written a bit of ggplot code
- Get my data in to R
- Make a plot with it

A composite image featuring two distinct scenes. On the left, a man in a dark suit and tie stands in a doorway, looking shocked or surprised. On the right, a massive, multi-headed lizard with a textured, scaly skin pattern dominates the frame, its mouth slightly open. The overall composition is a collage of different elements.

Feed ggplot tidy data
FEED ME

What is tidy data?

gdp	lifexp	pop	continent
340	65	31	Euro
227	51	200	Amer
909	81	80	Euro
126	40	20	Asia

What is tidy data?

gdp	lifexp	pop	continent
340	65	31	Euro
227	51	200	Amer
909	81	80	Euro
126	40	20	Asia

Essentially: data in *long* format.

Every column is a single variable

country	year	cases	population
Afghanistan	1999	745	16567071
Afghanistan	2000	2666	20595360
Brazil	1999	31737	172006362
Brazil	2000	80488	174504898
China	1999	212258	1272915272
China	2000	21166	128028583

variables

Every row is a single observation

country	year	cases	population
Iran (Islamic Republic of)	1993	743	195870
Iran (Islamic Republic of)	2000	2000	205500
Brazil	1993	87787	172000000
Brazil	2000	80400	174500000
China	1993	212200	12720102
China	2000	210700	12004200

observations

Every cell is a single value

country	year	cases	population
Afghanistan	99	745	19981071
Afghanistan	2000	2686	20599360
	99	37737	172009362
Brazil	100	80483	174504898
	99	212253	127291272
China	100	213766	1280421583
	values		

Get your data into long format

Very, *very* often, the solution to some data-wrangling or data visualization problem in a Tidyverse-focused workflow is:

Get your data into long format

Very, *very* often, the solution to some data-wrangling or data visualization problem in a Tidyverse-focused workflow is:

First, get the data into long format.

Then do the thing you want.

Untidy data is common for good reasons!

Storing and printing data in long format entails a lot of *repetition* and *redundancy*:

```
library(palmerpenguins)
penguins %>
  group_by(species, island, year) %>
  summarize(bill = round(mean(bill_length_mm, na.rm = TRUE), 2)) %>
  knitr::kable()
```

species	island	year	bill
Adelie	Biscoe	2007	38.32
Adelie	Biscoe	2008	38.70
Adelie	Biscoe	2009	39.69
Adelie	Dream	2007	39.10
Adelie	Dream	2008	38.19
Adelie	Dream	2009	38.15
Adelie	Torgersen	2007	38.80
Adelie	Torgersen	2008	38.77
Adelie	Torgersen	2009	39.31
Chinstrap	Dream	2007	48.72

Untidy data is common for good reasons

A wide format is *easier* and *more efficient* to read in print:

```
penguins >  
  group_by(species, island, year) >  
  summarize(bill = round(mean(bill_length_mm, na.rm = TRUE), 2)) >  
  pivot_wider(names_from = year, values_from = bill) >  
  knitr::kable()
```

species	island	2007	2008	2009
Adelie	Biscoe	38.32	38.70	39.69
Adelie	Dream	39.10	38.19	38.15
Adelie	Torgersen	38.80	38.77	39.31
Chinstrap	Dream	48.72	48.70	49.05
Gentoo	Biscoe	47.01	46.94	48.50

(Again, these tables are made directly in R with the code you see here.)

It's also common for *less* good reasons

😡 More than one header row

😡 Mixed data types in some columns

💀 Color and typography used to encode variables and their values

Fix it **before** you import it

Prevention is better than cure!

An excellent article by Karl Broman and Kara Woo:

Broman KW, Woo KH (2018) "Data organization in spreadsheets." *The American Statistician* 78:2–10

The screenshot shows a digital journal article page. At the top left, it displays 'THE AMERICAN STATISTICIAN' and '2018, VOL. 72, NO. 1, 2-10'. Below this is the DOI: <https://doi.org/10.1080/00031305.2017.1375989>. On the right side, there is a logo for 'Taylor & Francis' and 'Taylor & Francis Group'. Below the logo, there are buttons for 'OPEN ACCESS' and 'Check for updates'. The main title of the article is 'Data Organization in Spreadsheets', which is bolded. Below the title, the authors are listed as 'Karl W. Broman^a and Kara H. Woo^b'. A small note indicates superscripts: ^aDepartment of Biostatistics & Medical Informatics, University of Wisconsin-Madison, Madison, WI; ^bInformation School, University of Washington, Seattle, WA. In the bottom left corner of the article preview, there is a section titled 'ABSTRACT' with a detailed description of the article's content. In the bottom right corner, there are sections for 'ARTICLE HISTORY' (Received June 2017, Revised August 2017) and 'KEYWORDS' (Data management; Data organization; Microsoft Excel; Spreadsheets).

The most common `tidyverse` operation

Pivoting from wide to long:

```

Here, a "Level of Schooling Attained" variable is spread across the columns, from `elem4` to `coll4`.

This is fine for a compact table, but we need a *key* column called "education" with the various levels of schooling, and a corresponding *value* column containing the counts.

From wide to long with pivot_longer()

We're going to put the columns elem4:coll4 into a new column, creating a new categorical measure named **education**. The numbers currently under each column will become a new **value** column corresponding to that level of education.

```
edu >
  pivot_longer(elem4:coll4, names_to = "education")

## # A tibble: 2,196 × 7
##   age   sex   year total median education value
##   <chr> <chr> <int> <int> <dbl> <chr>     <dbl>
## 1 25-34 Male   2016 21845     NA elem4      116
## 2 25-34 Male   2016 21845     NA elem8      468
## 3 25-34 Male   2016 21845     NA hs3       1427
## 4 25-34 Male   2016 21845     NA hs4       6386
## 5 25-34 Male   2016 21845     NA coll3     6015
## 6 25-34 Male   2016 21845     NA coll4     7432
## 7 25-34 Male   2015 21427     NA elem4      166
## 8 25-34 Male   2015 21427     NA elem8      488
## 9 25-34 Male   2015 21427     NA hs3       1584
## 10 25-34 Male  2015 21427     NA hs4       6198
## # i 2,186 more rows
```

From wide to long with pivot_longer()

We can name the value column to whatever we like. Here it's a number of people.

```
edu >
pivot_longer(elem4:coll4,
             names_to = "education",
             values_to = "n")

## # A tibble: 2,196 × 7
##   age   sex   year total median education     n
##   <chr> <chr> <int> <int>  <dbl> <chr>      <dbl>
## 1 25-34 Male   2016 21845     NA elem4       116
## 2 25-34 Male   2016 21845     NA elem8       468
## 3 25-34 Male   2016 21845     NA hs3        1427
## 4 25-34 Male   2016 21845     NA hs4        6386
## 5 25-34 Male   2016 21845     NA coll3      6015
## 6 25-34 Male   2016 21845     NA coll4      7432
## 7 25-34 Male   2015 21427     NA elem4      166
## 8 25-34 Male   2015 21427     NA elem8      488
## 9 25-34 Male   2015 21427     NA hs3        1584
## 10 25-34 Male  2015 21427     NA hs4        6198
## # i 2,186 more rows
```

How to get your own data into R

Reading in CSV files

Base R has `read.csv()`

Reading in CSV files

Base R has `read.csv()`

Corresponding tidyverse "underscored" version: `read_csv()`.

It is pickier and more talkative than the Base R version. Use it instead.

Where's my data? Using `here()`

If we're loading a file, it's coming from *somewhere*.

If it's a file on our hard drive somewhere, we will need to interact with the file system. We should try to do this in a way that avoids *absolute* file paths.

```
# This is not portable!
df ← read_csv("/Users/kjhealy/Documents/data/misc/project/data/mydata.csv")
```

Where's my data? Using `here()`

If we're loading a file, it's coming from *somewhere*.

If it's a file on our hard drive somewhere, we will need to interact with the file system. We should try to do this in a way that avoids *absolute* file paths.

```
# This is not portable!
df ← read_csv("/Users/kjhealy/Documents/data/misc/project/data/mydata.csv")
```

We should also do it in a way that is *platform independent*.

This makes it easier to share your work, move it around, etc. Projects should be self-contained.

Where's my data? Using `here()`

The `here` package, and `here()` function builds paths relative to the top level of your R project.

```
here() # this path will be different for you  
## [1] "/Users/kjhealy/Documents/courses/data_visualization"
```

Where's the data? Using `here()`

This seminar's files all live in an RStudio project. It looks like this:

```
## /Users/kjhealy/Documents/courses/data_visualization
##   └── LICENSE
##   └── Makefile
##   └── README.Rmd
##   └── README.md
##   └── bonus_features
##   └── code
##   └── course_notes.Rmd
##   └── data
##   └── data_visualization.Rproj
##   └── figures
##   └── keynote
##   └── package-lock.json
##   └── pdf_slides
##   └── slides
```

I want to load files from the `data` folder, but I also want *you* to be able to load them. I'm writing this from somewhere deep in the `slides` folder, but you won't be there. Also, I'm on a Mac, but you may not be.

Where's the data? Using `here()`

So:

```
## Load the file relative to the path from the top of the project, without separators, etc  
organs ← read_csv(file = here("data", "organdonation.csv"))
```

Where's the data? Using `here()`

So:

```
## Load the file relative to the path from the top of the project, without separators, etc
organs ← read_csv(file = here("data", "organdonation.csv"))

organs

## # A tibble: 238 × 21
##   country year donors   pop pop.dens    gdp gdp.lag health health.lag pubhealth

## 6 Austra...    1995  10.2 18072  0.233 21079  19849  1737    1626    5.5
## 7 Austra...    1996  10.6 18311  0.237 21923  21079  1846    1737    5.6
## 8 Austra...    1997  10.3 18518  0.239 22961  21923  1948    1846    5.7
## 9 Austra...    1998  10.5 18711  0.242 24148  22961  2077    1948    5.9
## 10 Austra...   1999    8.67 18926  0.244 25445  24148  2231    2077    6.1
## # i 228 more rows
## # i 11 more variables: roads <dbl>, cerebvas <dbl>, assault <dbl>,
## # external <dbl>, txp.pop <dbl>, world <chr>, opt <chr>, consent.law <chr>,
## # consent.practice <chr>, consistent <chr>, ccode <chr>
```

And there it is.

`read_csv()` comes in different varieties

`read_csv()` Field separator is a comma: ,

```
organs ← read_csv(file = here("data", "organdonation.csv"))
```

`read_csv2()` Field separator is a semicolon: ;

```
# Example only  
my_data ← read_csv2(file = here("data", "my_euro_file.csv"))
```

Both are special cases of `read_delim()`

Other species are also catered to

`read_tsv()` Tab separated.

`read_fwf()` Fixed-width files.

`read_log()` Log files (i.e. computer log files).

`read_lines()` Just read in lines, without trying to parse them.

Also often useful ...

`read_table()`

For data that's separated by one (or more) columns of space.

And for foreign file formats ...

The tidyverse's **haven** package provides

`read_dta()` Stata

`read_spss()` SPSS

`read_sas()` SAS

`read_xpt()` SAS Transport

Make these functions available with `library(haven)`

You can read files remotely, too

You can give these functions local files, or they can also be pointed at URLs.

Compressed files (.zip, .tar.gz) will be automatically uncompressed.

(Be careful what you download from remote locations!)

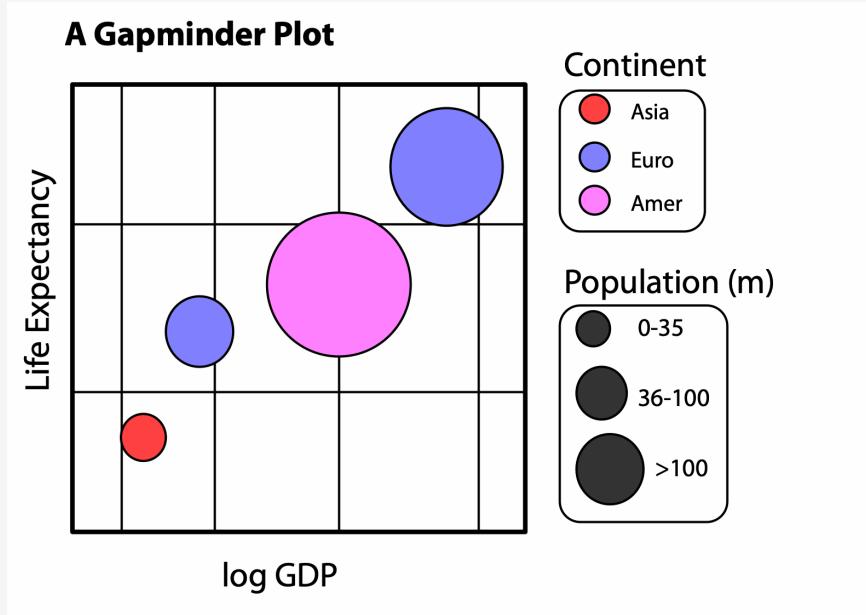

```
organ_remote <- read_csv("http://kjhealy.co/organdonation.csv")

organ_remote

With the plot itself also **titled** and
labeled.

How ggplot does this

ggplot's flow of action

Here's the whole thing from start to finish

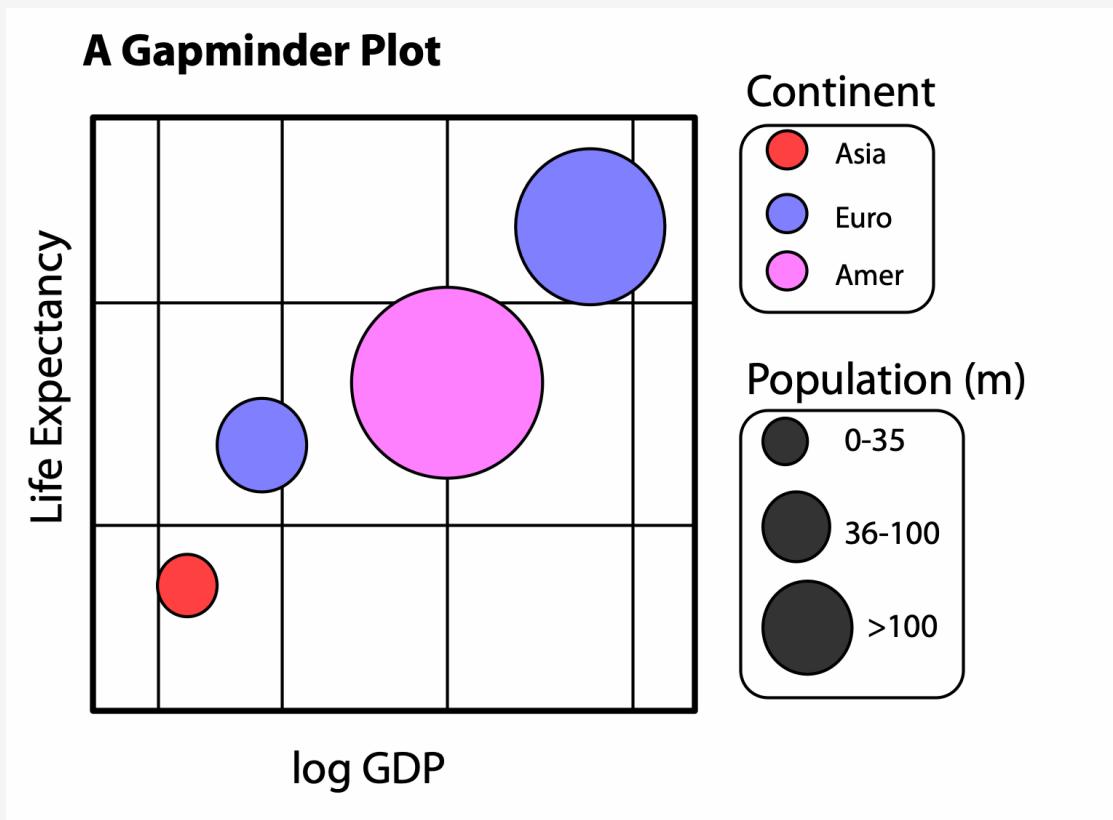

We'll go through it step by step

ggplot's flow of action

gdp	lifexp	pop	continent
340	65	31	Euro
227	51	200	Amer
909	81	80	Euro
126	40	20	Asia

ggplot's flow of action

ggplot's flow of action

1. Tidy Data

```
p <- ggplot(data = gapminder, ...)
```

gdp	lifexp	pop	continent
340	65	31	Euro
227	51	200	Amer
909	81	80	Euro
126	40	20	Asia

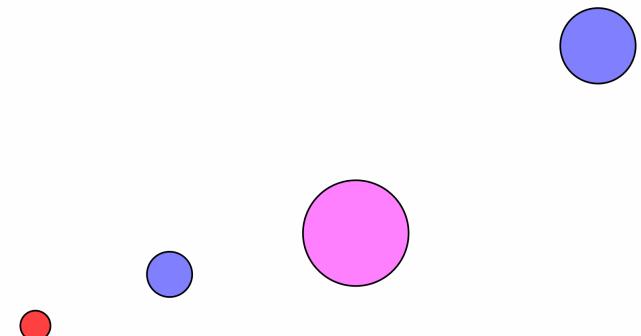

2. Map the Aesthetics

```
p <- ggplot(data = gapminder,  
             mapping = aes(x = gdp,  
                            y = lifexp,  
                            size = pop,  
                            color = continent))
```

x-axis will represent	y-axis will represent	size will represent	color will represent
gdp	lifexp	pop	continent
340	65	31	Euro

3. Pick a Geom

```
p + geom_point()
```

1. Get the data in the right shape.
This is usually **long** format.

2. Decide how your variables will be represented by things you can see.

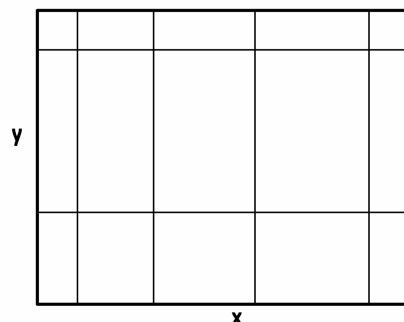

3. Decide what kind of plot, or series of plots, you want to draw.

ggplot's flow of action

4. Fix Scales and Co-Ordinate System

```
p + coord_cartesian() +  
  scale_x_log10()
```

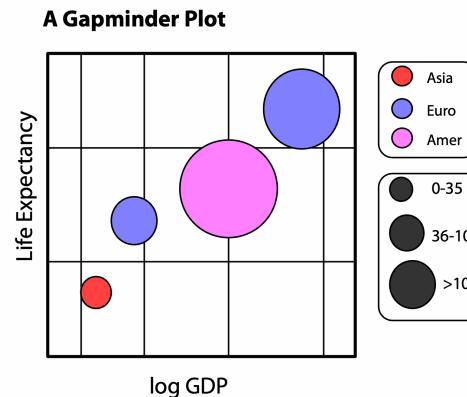

4. Adjust scales and their markings.
Not just x and y but also color, size, etc,

5. Add Labels and Adjust Guides

```
p + labs(x = "log GDP",  
         y = "Life Expectancy",  
         title = "A Gapminder Plot")
```

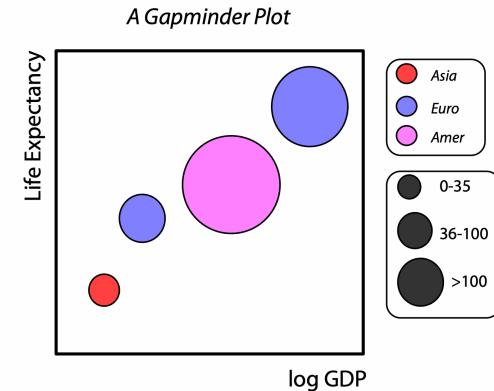

5. Label your plot and adjust how the guides are displayed.

6. Add or Adjust Themes

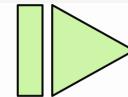

```
p + theme_minimal()
```

6. Style or adjust plot elements that are not directly representing your data.

ggplot's flow of action: **required**

1. Tidy Data

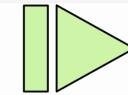

```
p ← ggplot(data = gapminder, ...)
```

gdp	lifexp	pop	continent
340	65	31	Euro
227	51	200	Amer
909	81	80	Euro
126	40	20	Asia

1. Get the data in the right shape.
This is usually **long** format.

ggplot's flow of action: **required**

2. Map the Aesthetics

```
p <- ggplot(data = gapminder,  
             mapping = aes(x = gdp,  
                            y = lifexp,  
                            size = pop,  
                            color = continent))
```

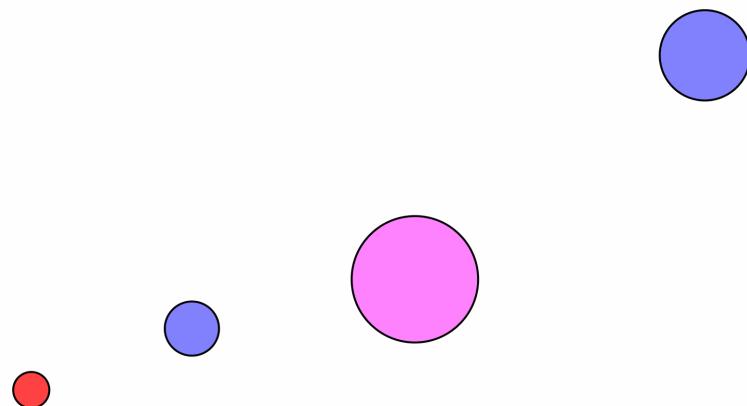

x-axis will represent	y-axis will represent	size will represent	color will represent
gdp	lifexp	pop	continent
340	65	31	Euro

2. Decide how your variables will be represented by things you can see.

ggplot's flow of action: **required**

3. Pick a Geom

```
p + geom_point()
```

3. Decide what kind of plot, or series of plots, you want to draw.

Let's go piece by piece

Start with the data

```
gapminder
```

```
## # A tibble: 1,704 × 6
##   country    continent  year lifeExp      pop gdpPercap
##   <fct>      <fct>    <int>  <dbl>     <int>     <dbl>
## 1 Afghanistan Asia      1952    28.8  8425333    779.
## 2 Afghanistan Asia      1957    30.3  9240934    821.
## 3 Afghanistan Asia      1962    32.0  10267083   853.
## 4 Afghanistan Asia      1967    34.0  11537966   836.
## 5 Afghanistan Asia      1972    36.1  13079460   740.
## 6 Afghanistan Asia      1977    38.4  14880372   786.
## 7 Afghanistan Asia      1982    39.9  12881816   978.
## 8 Afghanistan Asia      1987    40.8  13867957   852.
## 9 Afghanistan Asia      1992    41.7  16317921   649.
## 10 Afghanistan Asia     1997    41.8  22227415   635.
## # i 1,694 more rows
```

```
dim(gapminder)
```

```
## [1] 1704     6
```

Create a plot object

Data is the **gapminder** tibble.

```
p <- ggplot(data = gapminder)
```

Map variables to aesthetics

Tell **ggplot** the variables you want represented by visual elements on the plot

```
p <- ggplot(data = gapminder,  
             mapping = aes(x = gdpPercap,  
                            y = lifeExp))
```

Map variables to aesthetics

The `mapping = aes(...)` call links variables to things you will see on the plot.

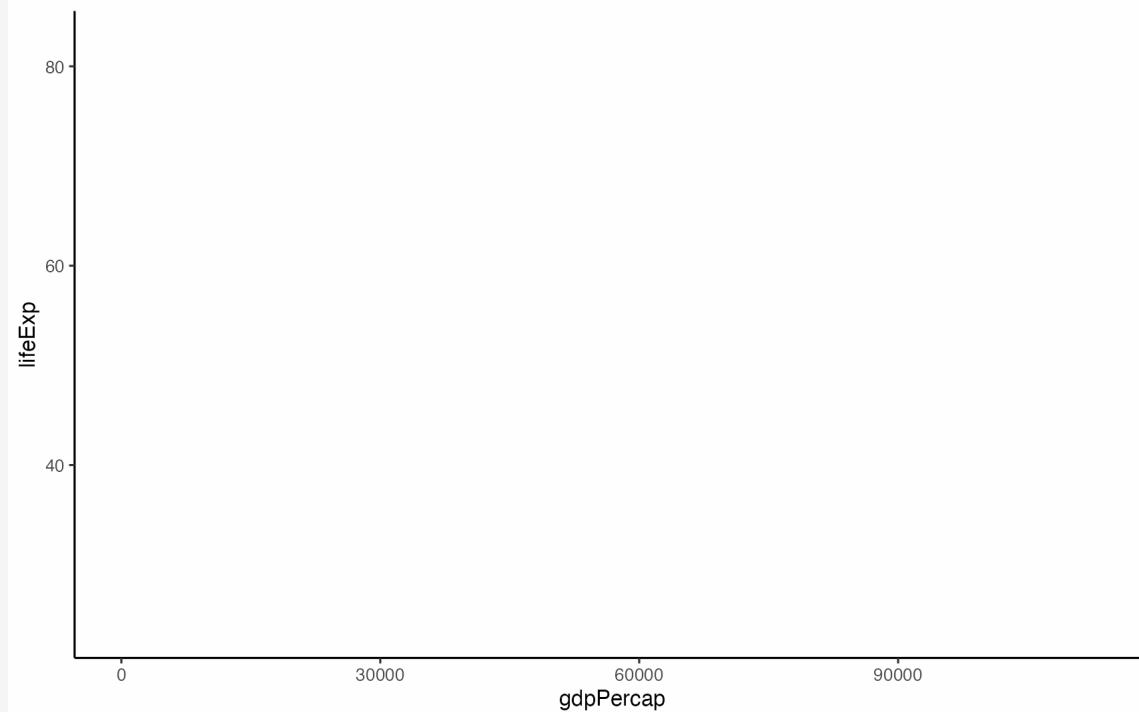

x and y represent the quantities determining position on the x and y axes.

Other aesthetic mappings can include, e.g., color, shape, size, and fill.

Mappings do not *directly* specify the particular, e.g., colors, shapes, or line styles that will appear on the plot. Rather, they establish *which variables* in the data will be represented by *which visible elements* on the plot.

p has data and mappings but no geom

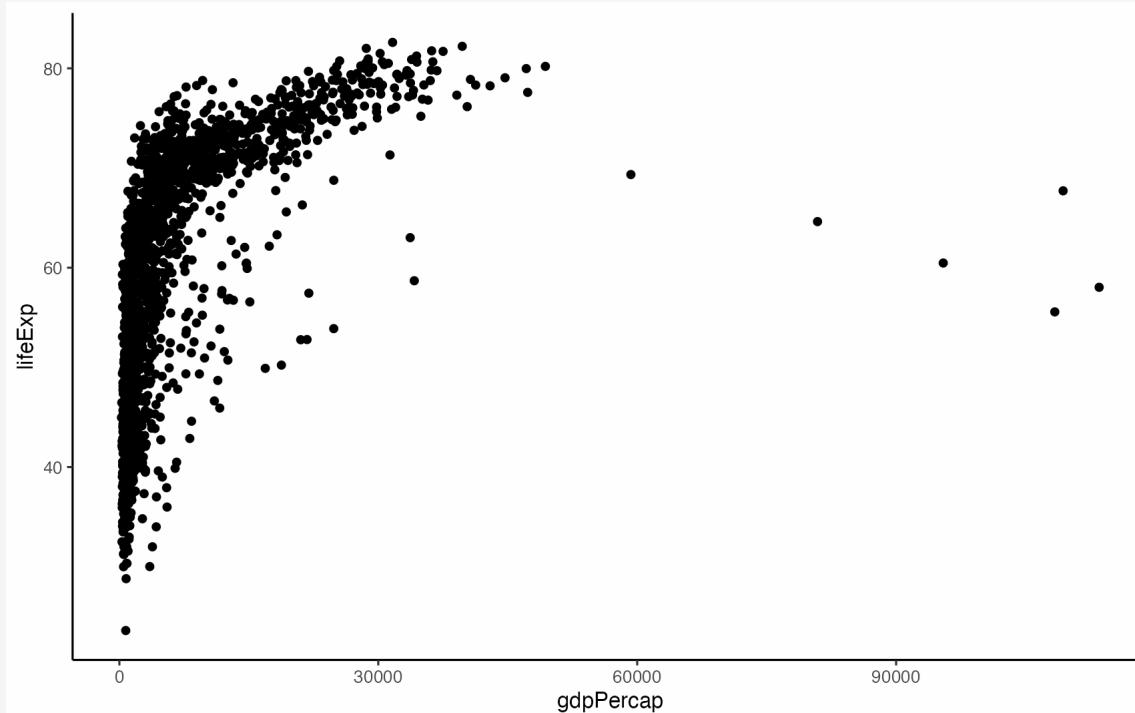

p

This empty plot has no geoms.

Add a geom

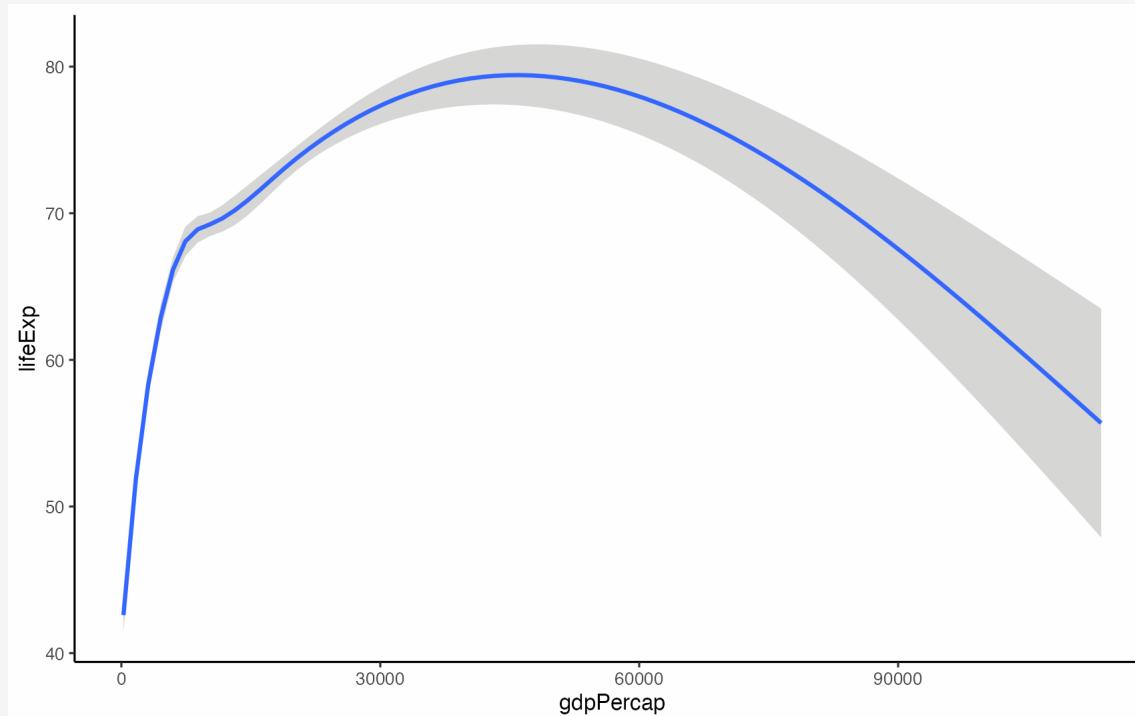

```
p + geom_point()
```

A scatterplot of Life Expectancy vs GDP

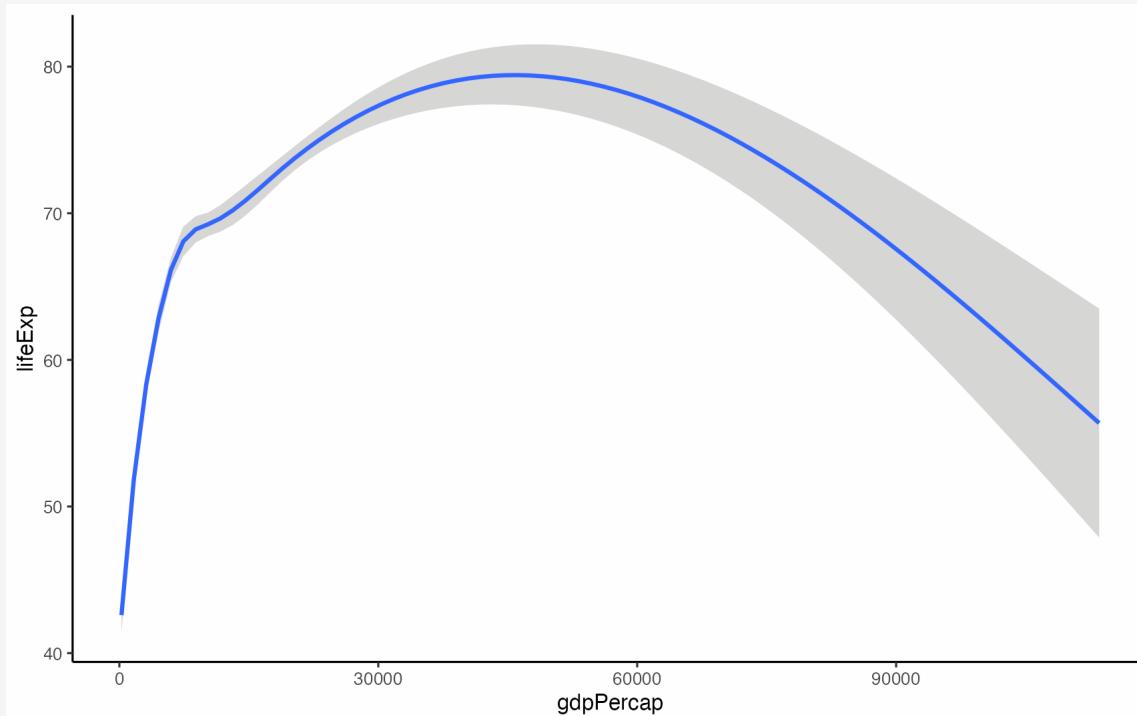

Try a different geom

```
p + geom_smooth()
```

Build your plots layer by layer

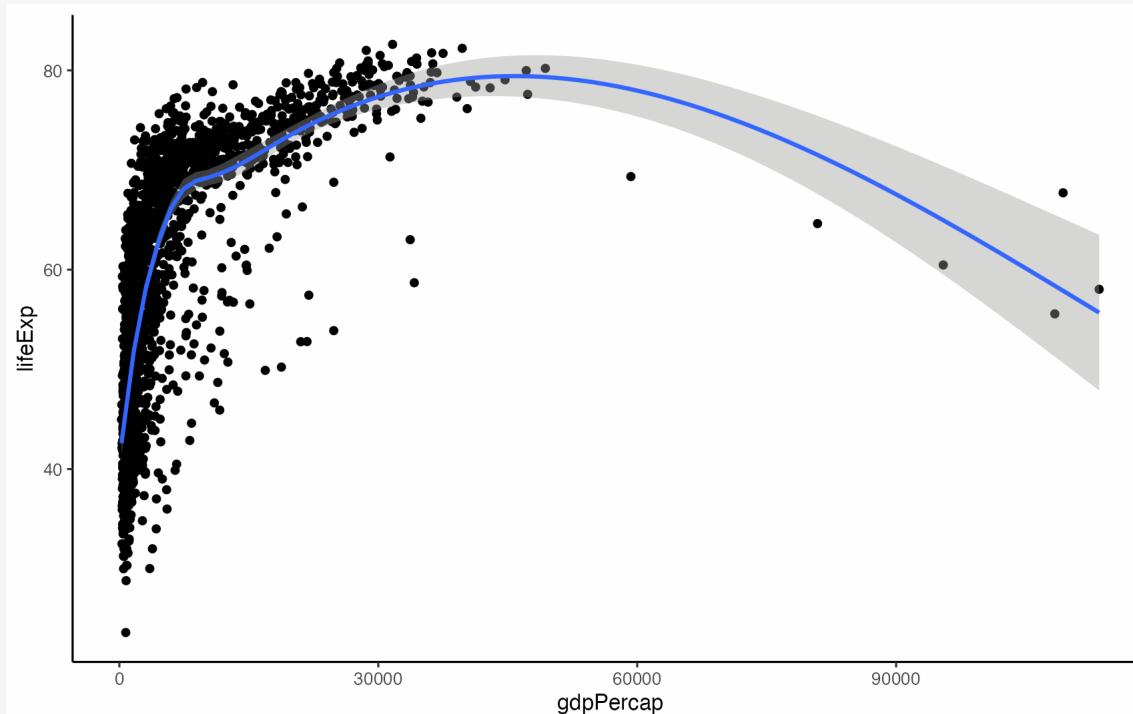

```
p <- ggplot(data = gapminder,  
             mapping = aes(x = gdpPercap,  
                           y=lifeExp))  
p + geom_smooth()
```

Life Expectancy vs GDP, using a smoother.

This process is additive

```
p <- ggplot(data = gapminder,  
             mapping = aes(x = gdpPercap,  
                            y=lifeExp))  
p + geom_point() + geom_smooth()
```

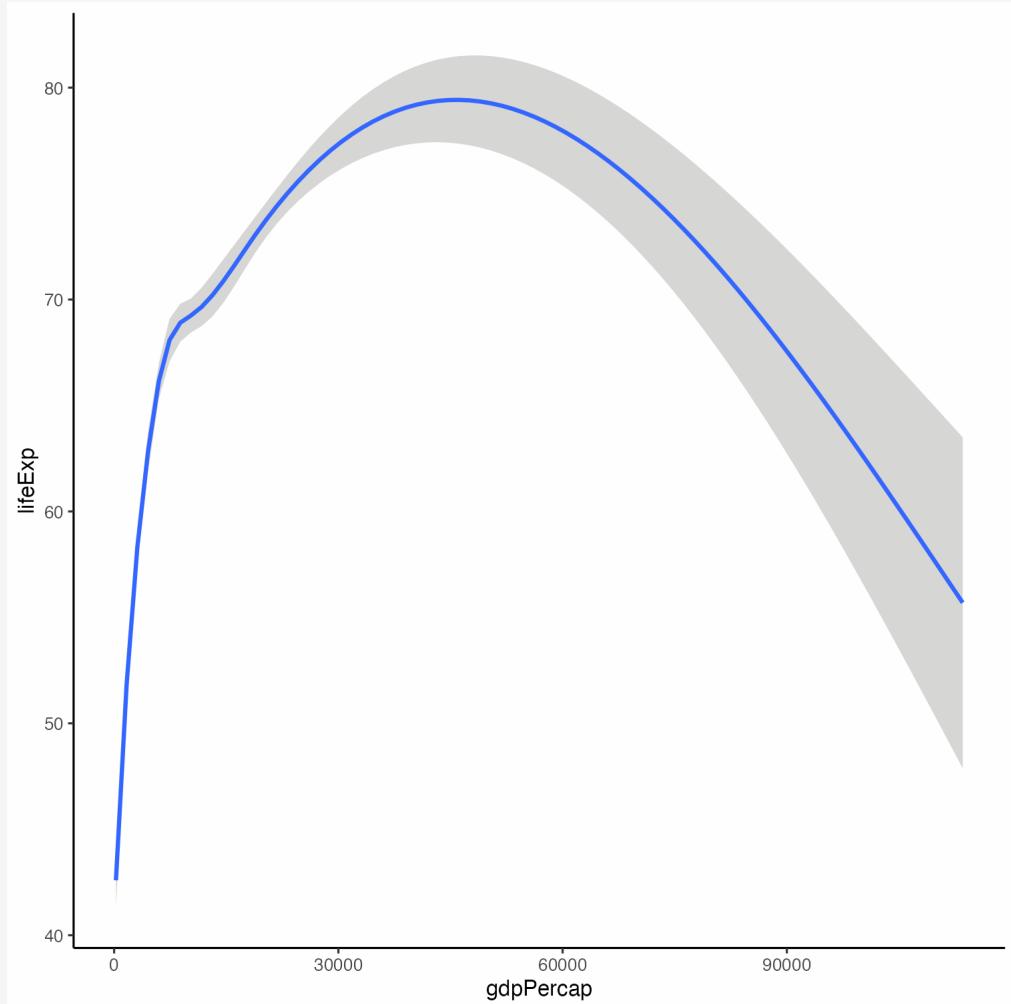

Life Expectancy vs GDP, using a smoother.

This process is additive

```
p ← ggplot(data = gapminder,  
            mapping = aes(x = gdpPercap,  
                           y=lifeExp))
```

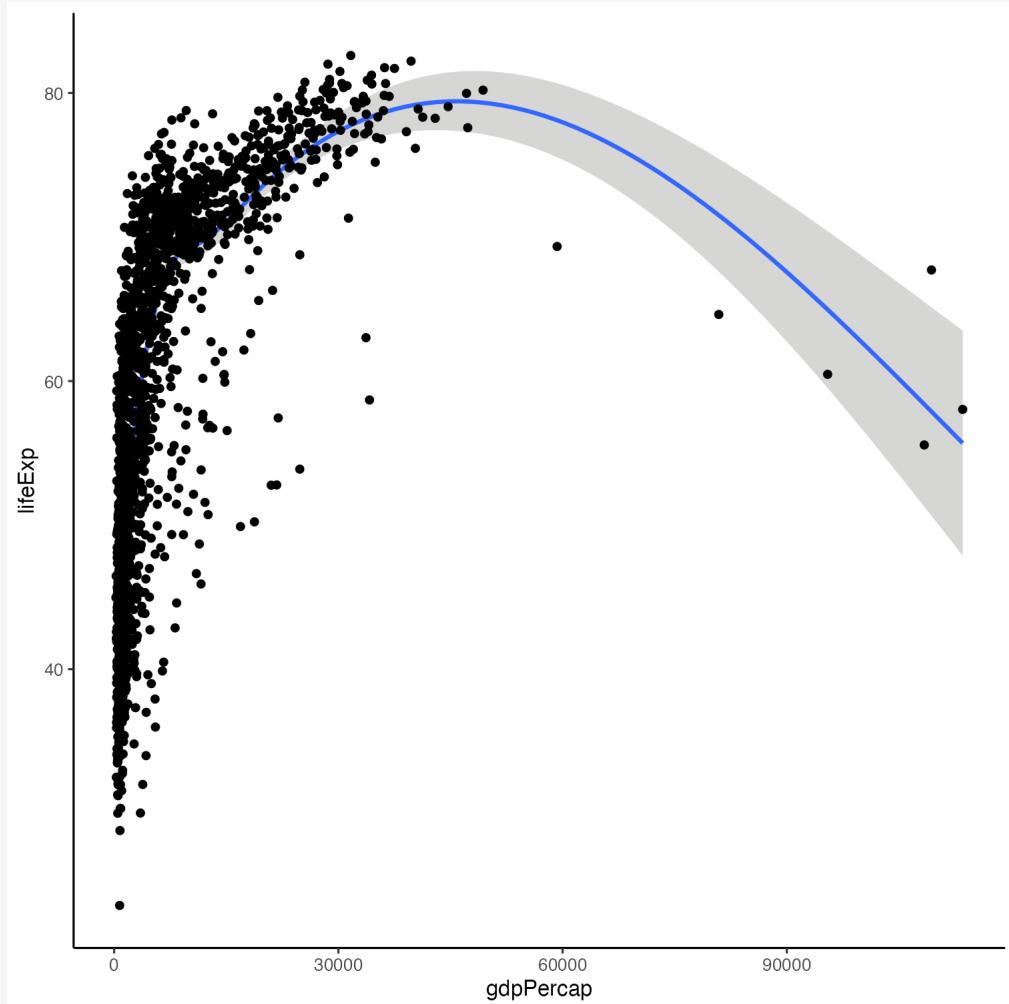

This process is additive

```
p <- ggplot(data = gapminder,  
             mapping = aes(x = gdpPercap,  
                            y=lifeExp))  
p + geom_smooth()
```

This process is additive

```
p <- ggplot(data = gapminder,  
             mapping = aes(x = gdpPercap,  
                            y=lifeExp))  
p + geom_smooth() +  
  geom_point()
```

Every geom is a function

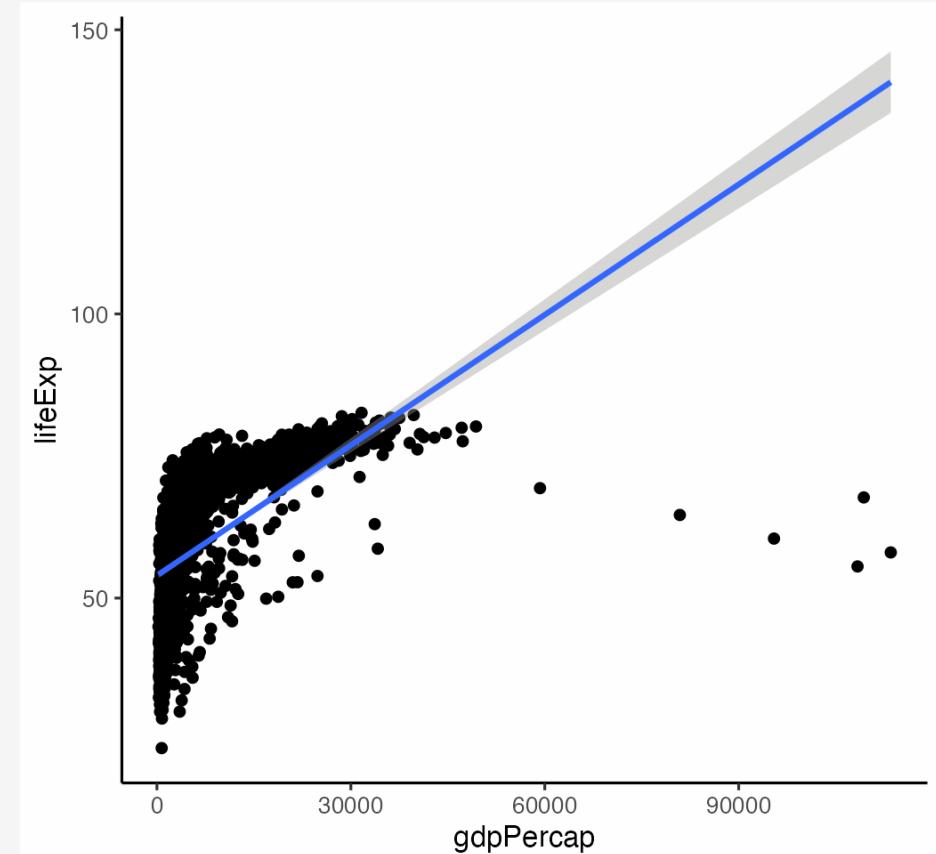

Functions take arguments

```
p ← ggplot(data = gapminder,  
            mapping = aes(x = gdpPercap,  
                           y = lifeExp))  
p + geom_point() +  
  geom_smooth(method = "lm")
```

Every geom is a function

Functions take arguments

```
p ← ggplot(data = gapminder,  
            mapping = aes(x = gdpPercap,  
                           y = lifeExp))  
  
p + geom_point() +  
  geom_smooth(method = "lm")
```

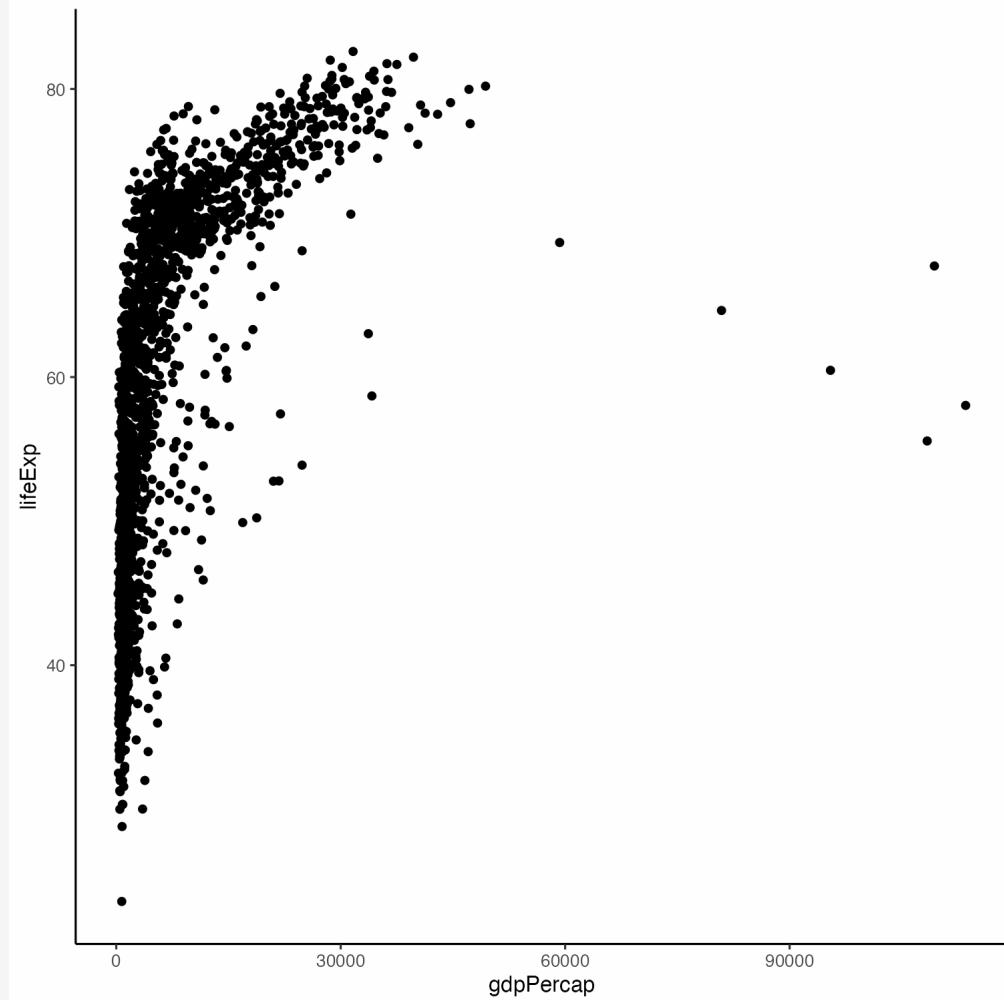

Keep Layering

```
p ← ggplot(data = gapminder,  
            mapping = aes(x = gdpPercap,  
                           y=lifeExp))
```

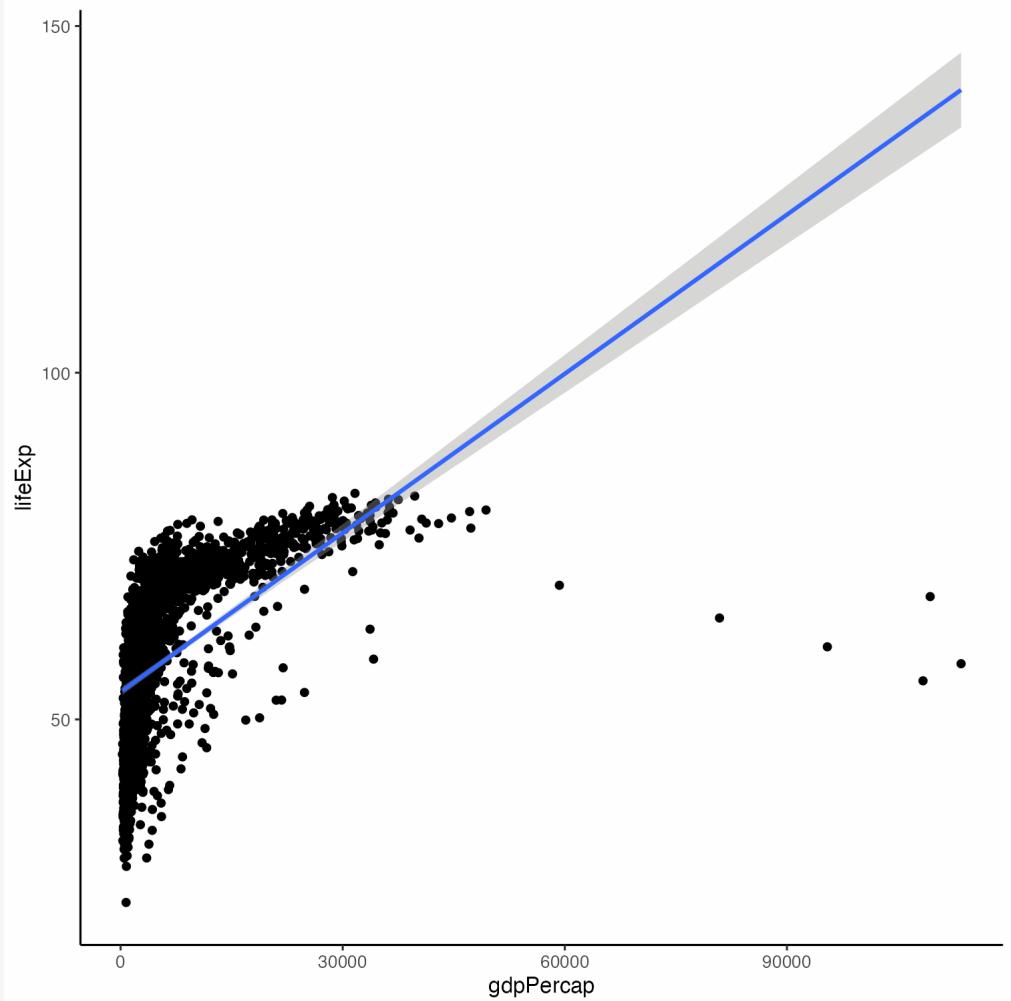

Keep Layering

```
p <- ggplot(data = gapminder,  
             mapping = aes(x = gdpPercap,  
                            y=lifeExp))  
p + geom_point()
```

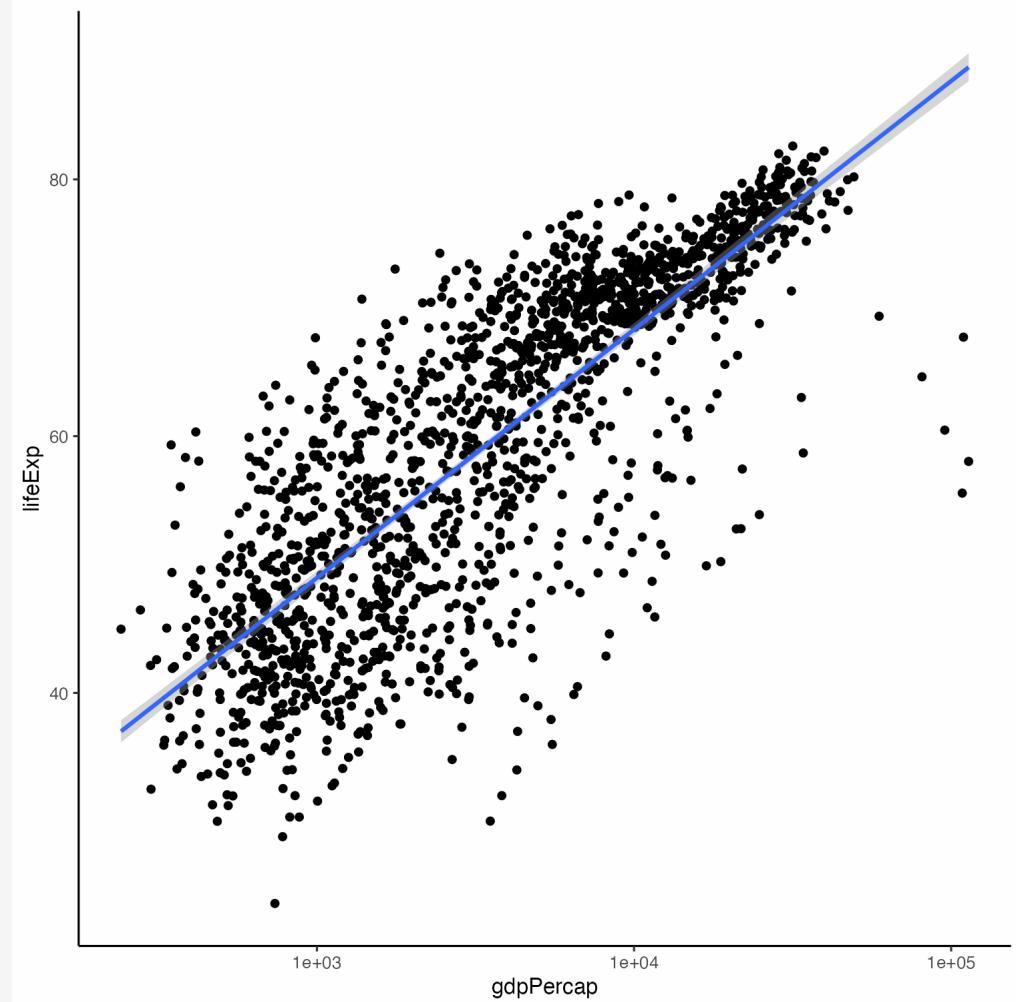

Keep Layering

```
p <- ggplot(data = gapminder,  
             mapping = aes(x = gdpPercap,  
                           y=lifeExp))  
p + geom_point() +  
  geom_smooth(method = "lm")
```

Keep Layering

```
p <- ggplot(data = gapminder,  
             mapping = aes(x = gdpPercap,  
                            y=lifeExp))  
  
p + geom_point() +  
  geom_smooth(method = "lm") +  
  scale_x_log10()
```

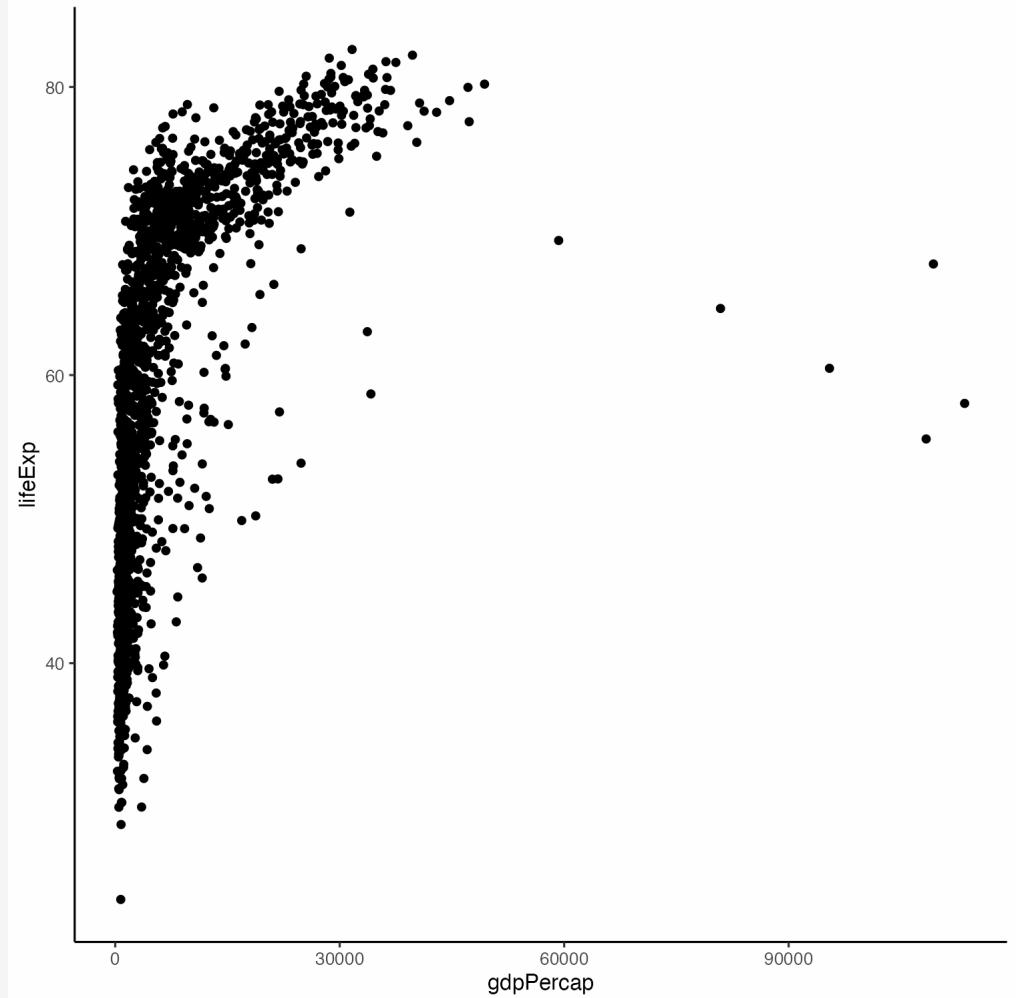

Fix the labels

```
p ← ggplot(data = gapminder,  
            mapping = aes(x = gdpPercap,  
                           y=lifeExp))
```

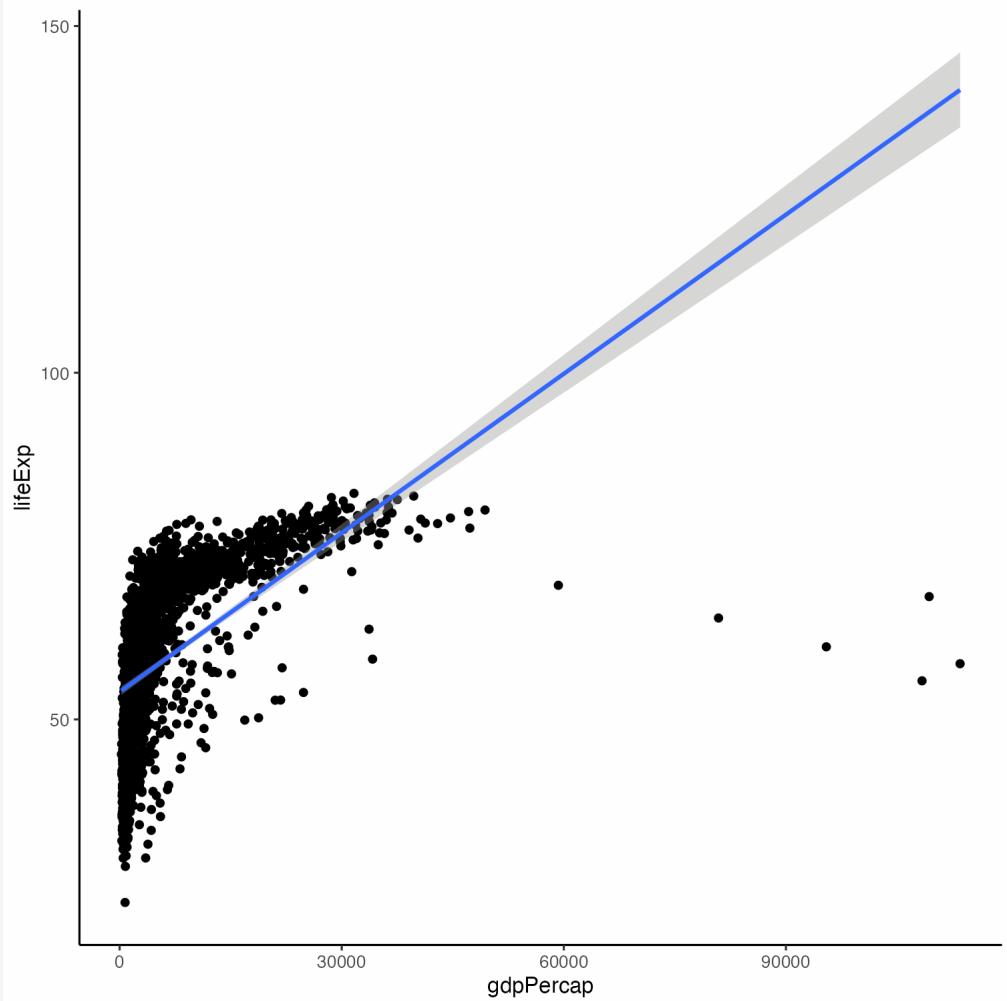

Fix the labels

```
p ← ggplot(data = gapminder,  
            mapping = aes(x = gdpPercap,  
                           y=lifeExp))  
p + geom_point()
```

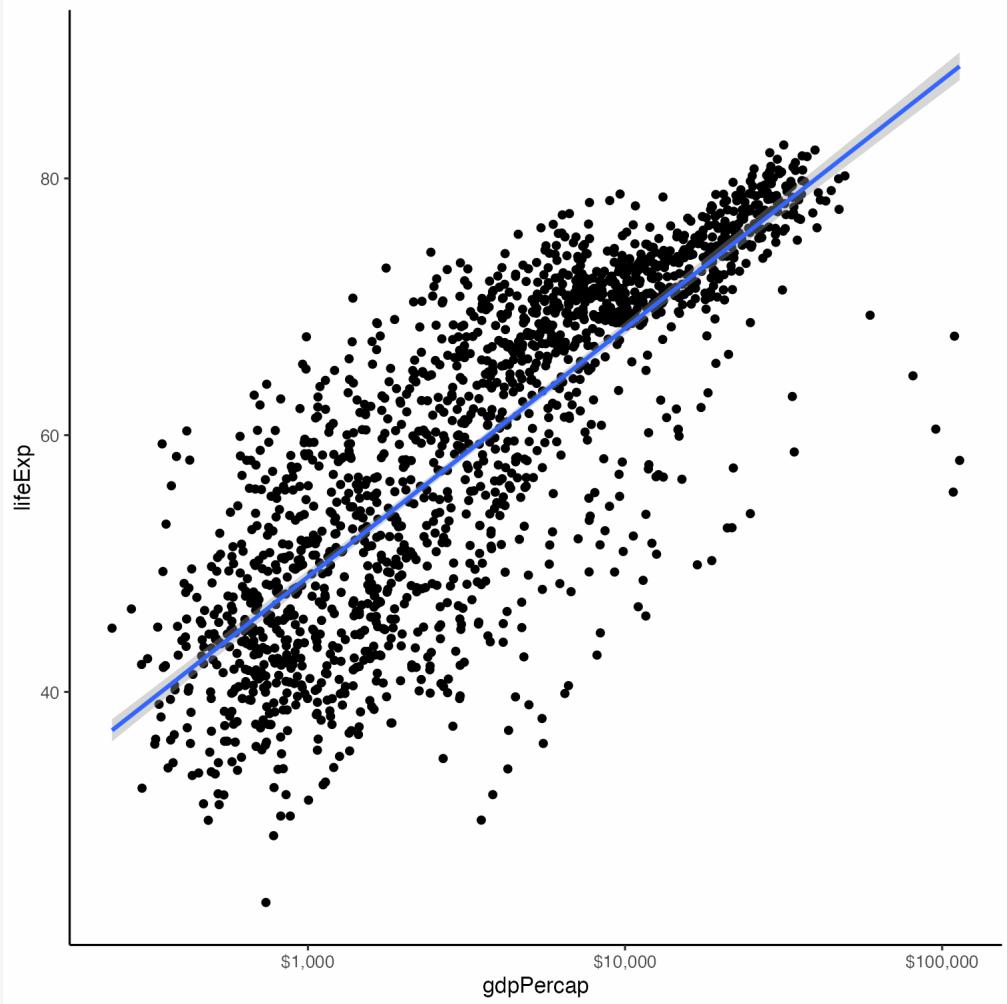

Fix the labels

```
p ← ggplot(data = gapminder,  
            mapping = aes(x = gdpPercap,  
                           y=lifeExp))  
p + geom_point() +  
  geom_smooth(method = "lm")
```

Fix the labels

```
p ← ggplot(data = gapminder,

  scale_x_log10(labels = scales::label_dollar())
```

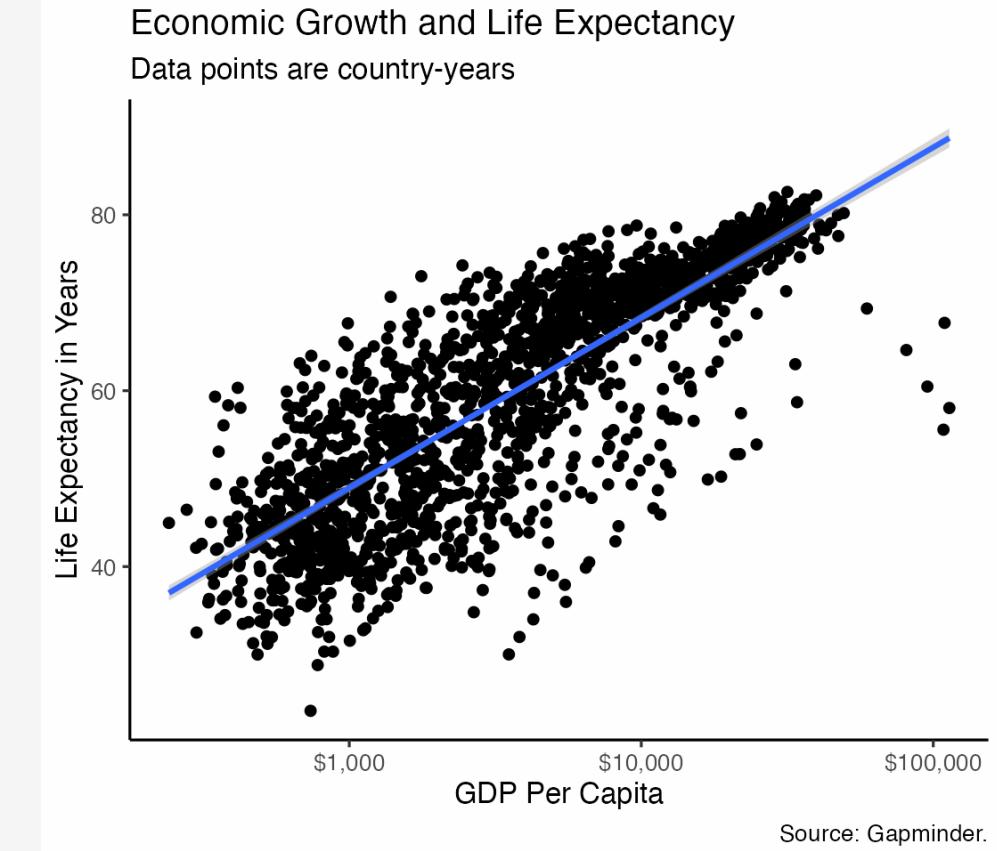

Add labels, title, and caption

```
p <- ggplot(data = gapminder,  
             mapping = aes(x = gdpPercap,  
                            y = lifeExp))  
p + geom_point() +  
  geom_smooth(method = "lm") +  
  scale_x_log10(labels = scales::label_dollar()) +  
  labs(x = "GDP Per Capita",  
        y = "Life Expectancy in Years",  
        title = "Economic Growth and Life Expectancy",  
        subtitle = "Data points are country-years",  
        caption = "Source: Gapminder.")
```

Add labels, title, and caption

```
p <- ggplot(data = gapminder,  
             mapping = aes(x = gdpPercap,  
                            y = lifeExp))  
  
p + geom_point() +  
  geom_smooth(method = "lm") +  
  scale_x_log10(labels = scales::label_dollar()) +  
  labs(x = "GDP Per Capita",  
       y = "Life Expectancy in Years",  
       title = "Economic Growth and Life Expectancy",  
       subtitle = "Data points are country-years",  
       caption = "Source: Gapminder.")
```

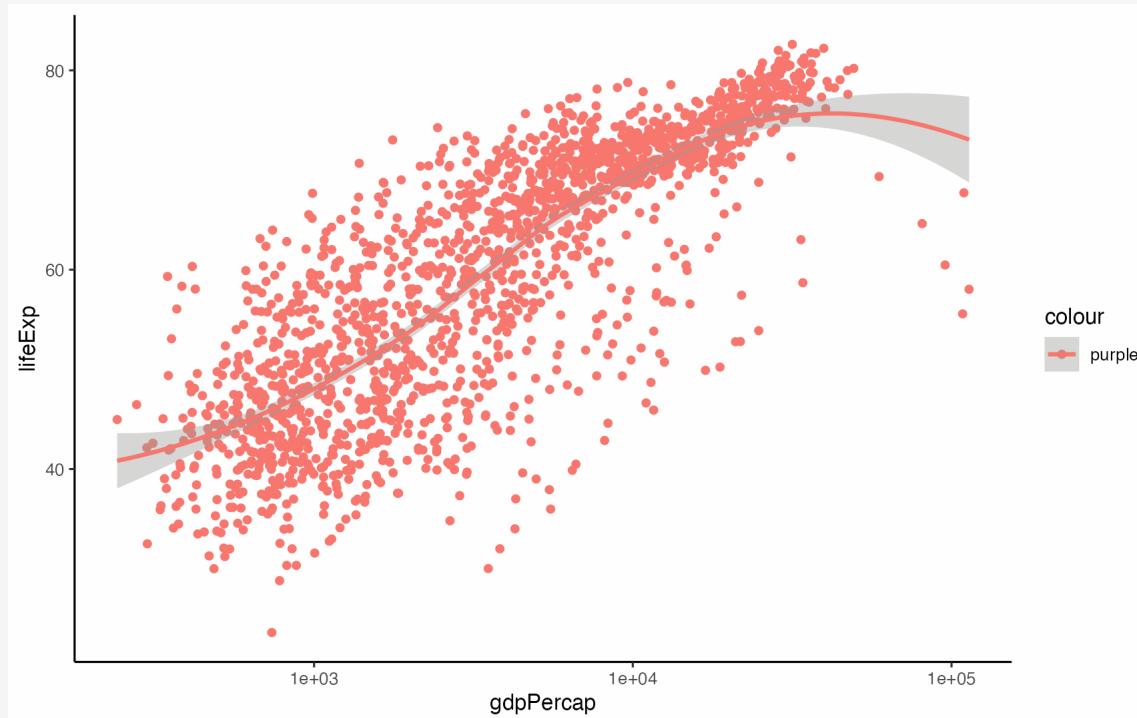

Mapping vs Setting your plot's aesthetics

"Can I change the color of the points?"

```
p <- ggplot(data = gapminder,  
             mapping = aes(x = gdpPercap,  
                            y = lifeExp,  
                            color = "purple"))  
  
## Put in an object for convenience  
p_out <- p + geom_point() +  
  geom_smooth(method = "loess") +  
  scale_x_log10()
```

What has gone wrong here?

p_out

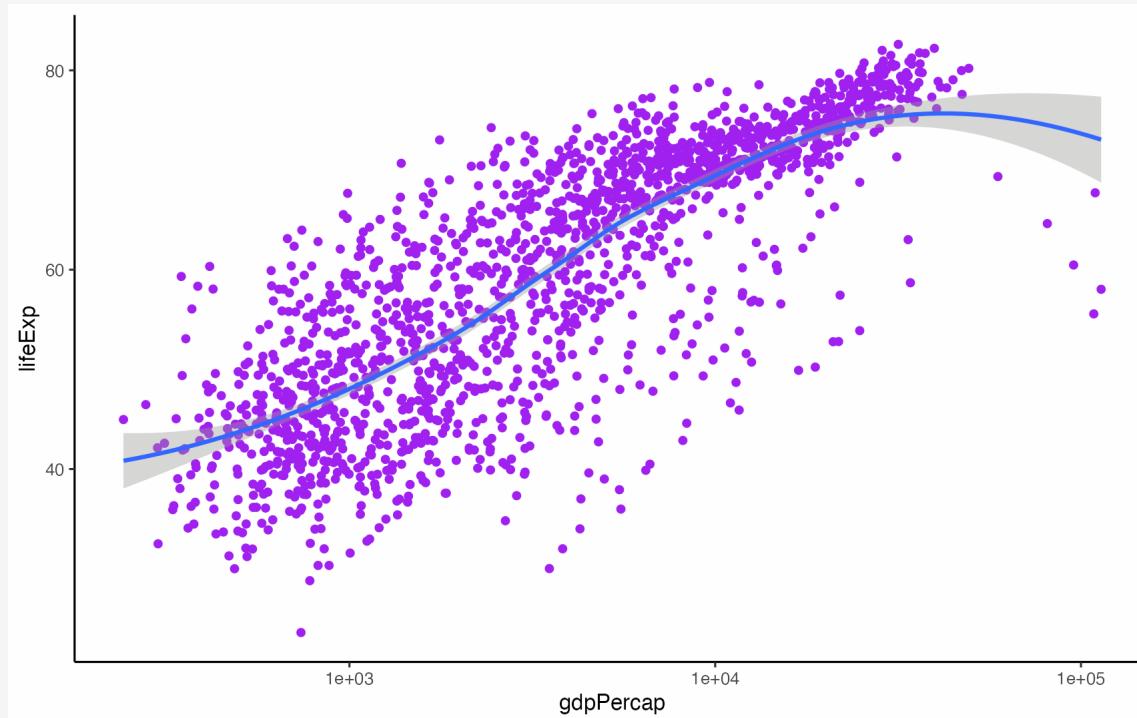

Try again

```
p <- ggplot(data = gapminder,  
             mapping = aes(x = gdpPercap,  
                            y = lifeExp))  
  
## Put in an object for convenience  
p_out <- p + geom_point(color = "purple") +  
  geom_smooth(method = "loess") +  
  scale_x_log10()
```

Try again

p_out

Geoms can take many arguments

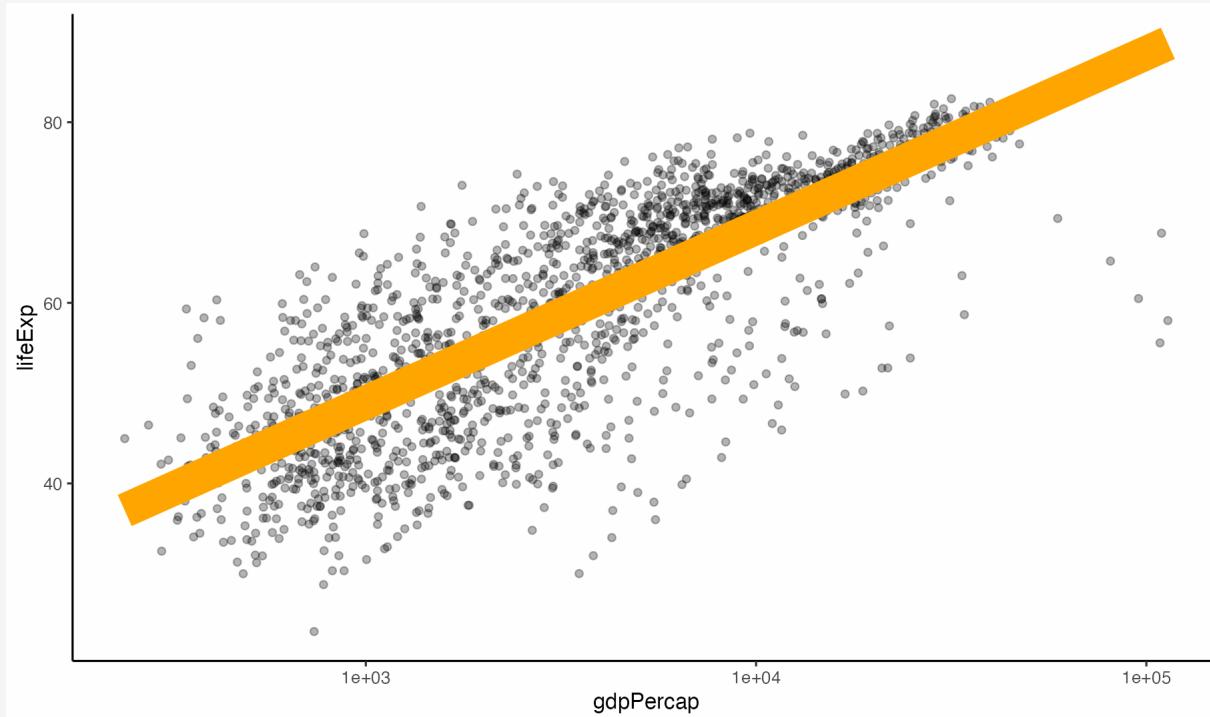

Here we **set** color, size, and alpha. Meanwhile x and y are **mapped**.

We also give non-default values to some other arguments

```
p ← ggplot(data = gapminder,  
            mapping = aes(x = gdpPercap,  
                           y = lifeExp))  
p_out ← p + geom_point(alpha = 0.3) +  
        geom_smooth(color = "orange",  
                     se = FALSE,  
                     linewidth = 8,  
                     method = "lm") +  
        scale_x_log10()
```

Geoms can take many arguments

p_out

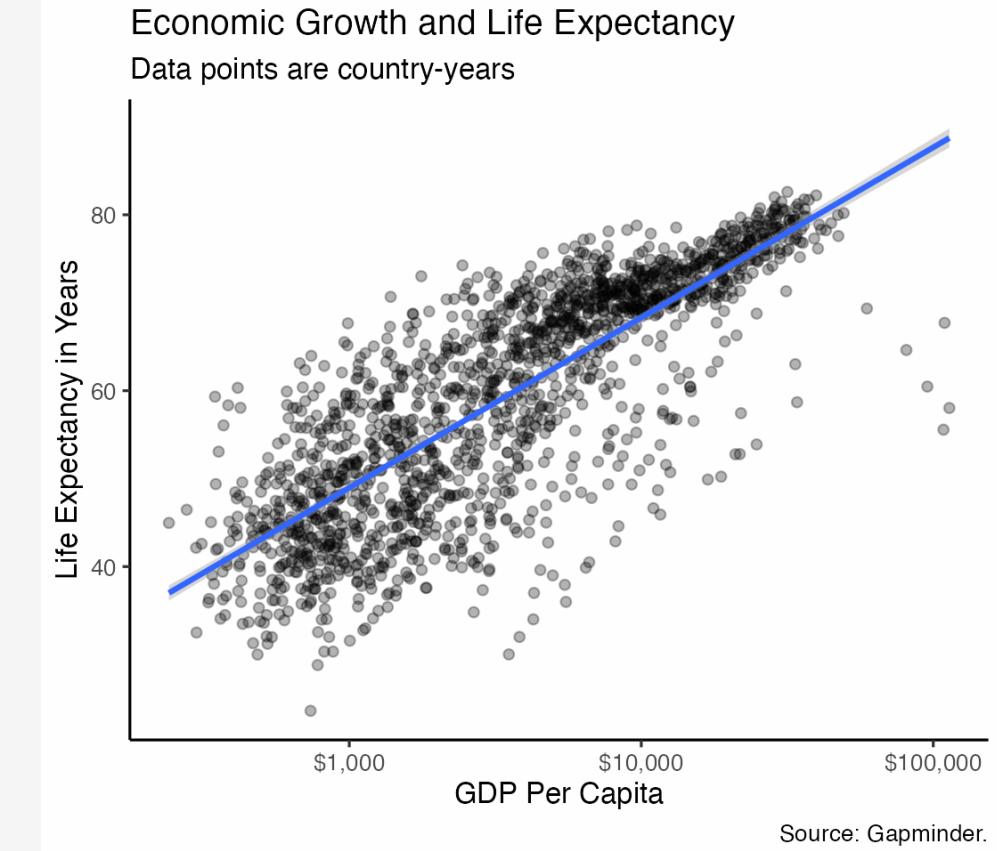

Setting alpha is handy for overplotted data

```
p <- ggplot(data = gapminder,
             mapping = aes(x = gdpPercap,
                            y = lifeExp))
p + geom_point(alpha = 0.3) +
  geom_smooth(method = "lm") +
  scale_x_log10(labels = scales::label_dollar()) +
  labs(x = "GDP Per Capita",
       y = "Life Expectancy in Years",
       title = "Economic Growth and Life Expectancy",
       subtitle = "Data points are country-years",
       caption = "Source: Gapminder.")
```

Setting alpha is handy for overplotted data

```
p ← ggplot(data = gapminder,  
            mapping = aes(x = gdpPercap,  
                           y = lifeExp))  
  
p + geom_point(alpha = 0.3) +  
  geom_smooth(method = "lm") +  
  scale_x_log10(labels = scales::label_dollar()) +  
  labs(x = "GDP Per Capita",  
       y = "Life Expectancy in Years",  
       title = "Economic Growth and Life Expectancy",  
       subtitle = "Data points are country-years",  
       caption = "Source: Gapminder.")
```

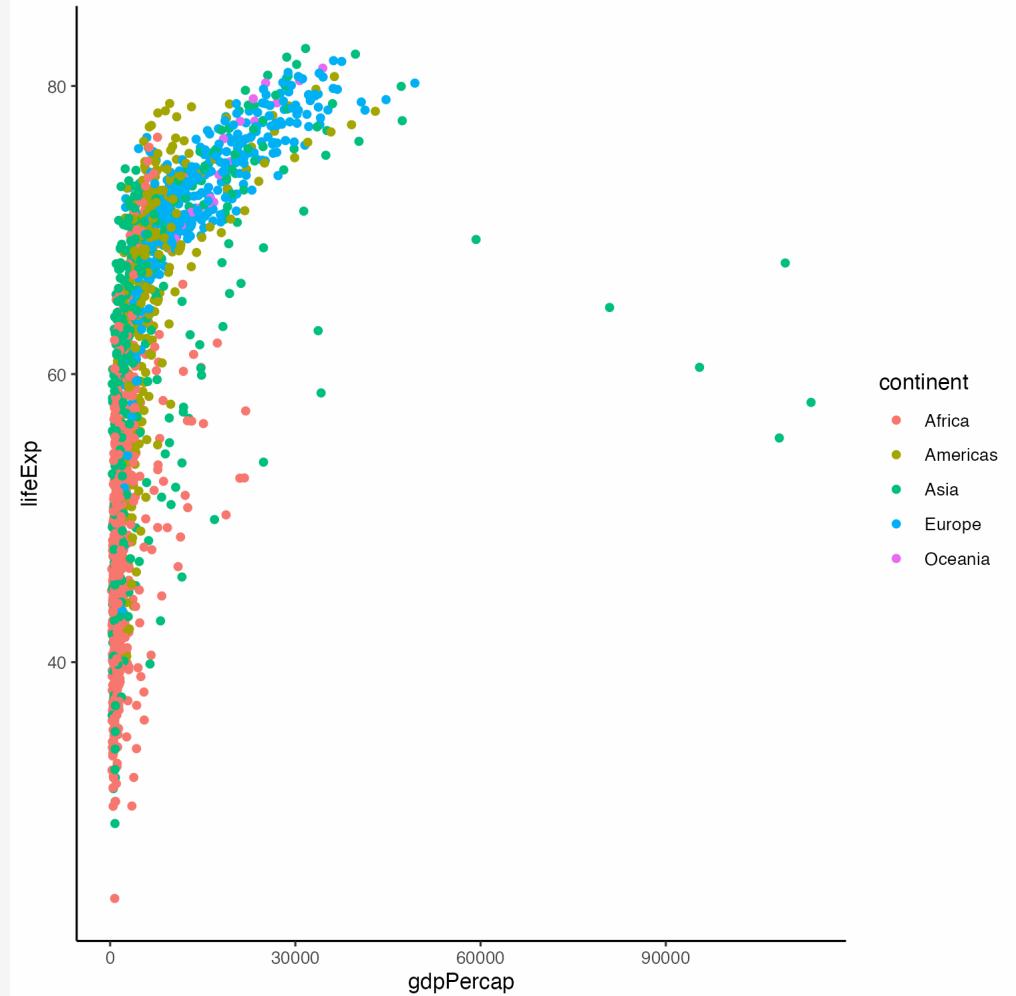

**Map or Set values
per geom**

Geoms can take their own mappings

```
p ← ggplot(data = gapminder,  
            mapping = aes(x = gdpPercap,  
                           y = lifeExp,  
                           color = continent,  
                           fill = continent))
```

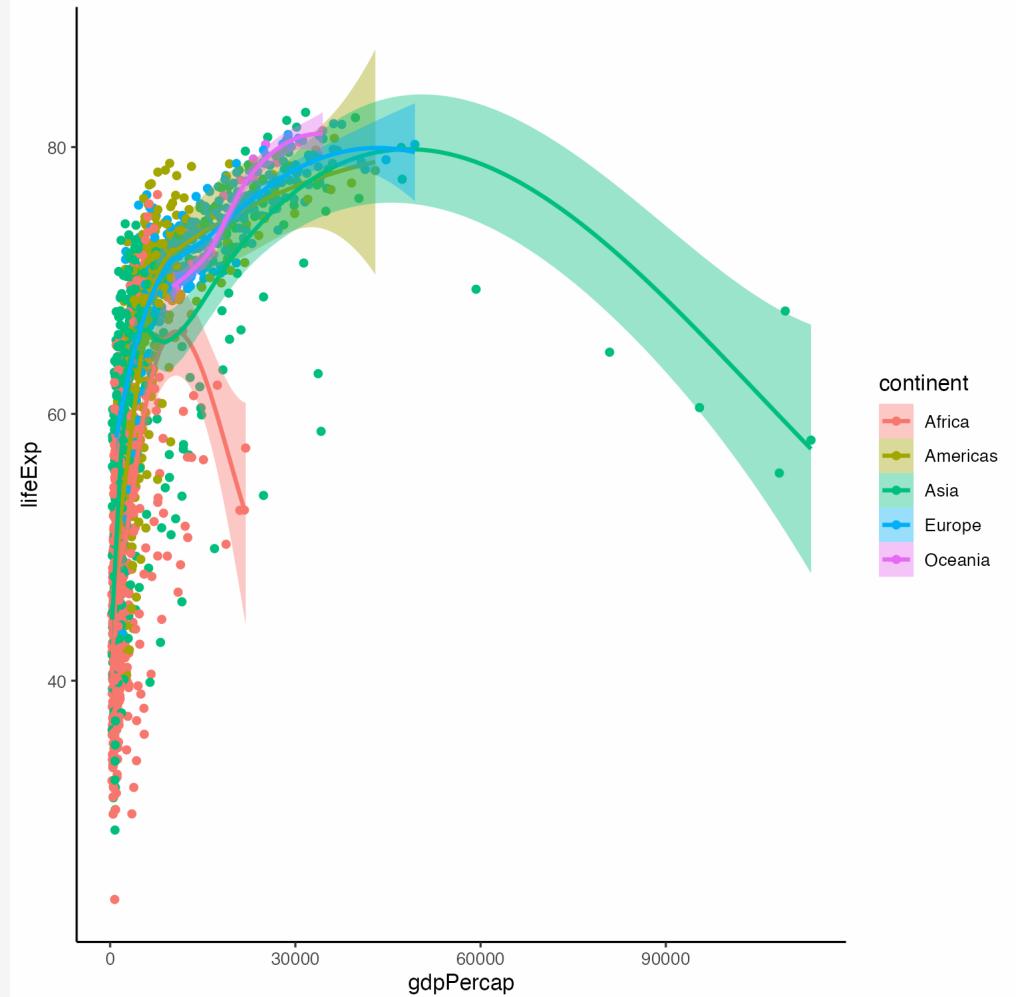

Geoms can take their own mappings

```
p <- ggplot(data = gapminder,  
             mapping = aes(x = gdpPercap,  
                            y = lifeExp,  
                            color = continent,  
                            fill = continent))  
p + geom_point()
```

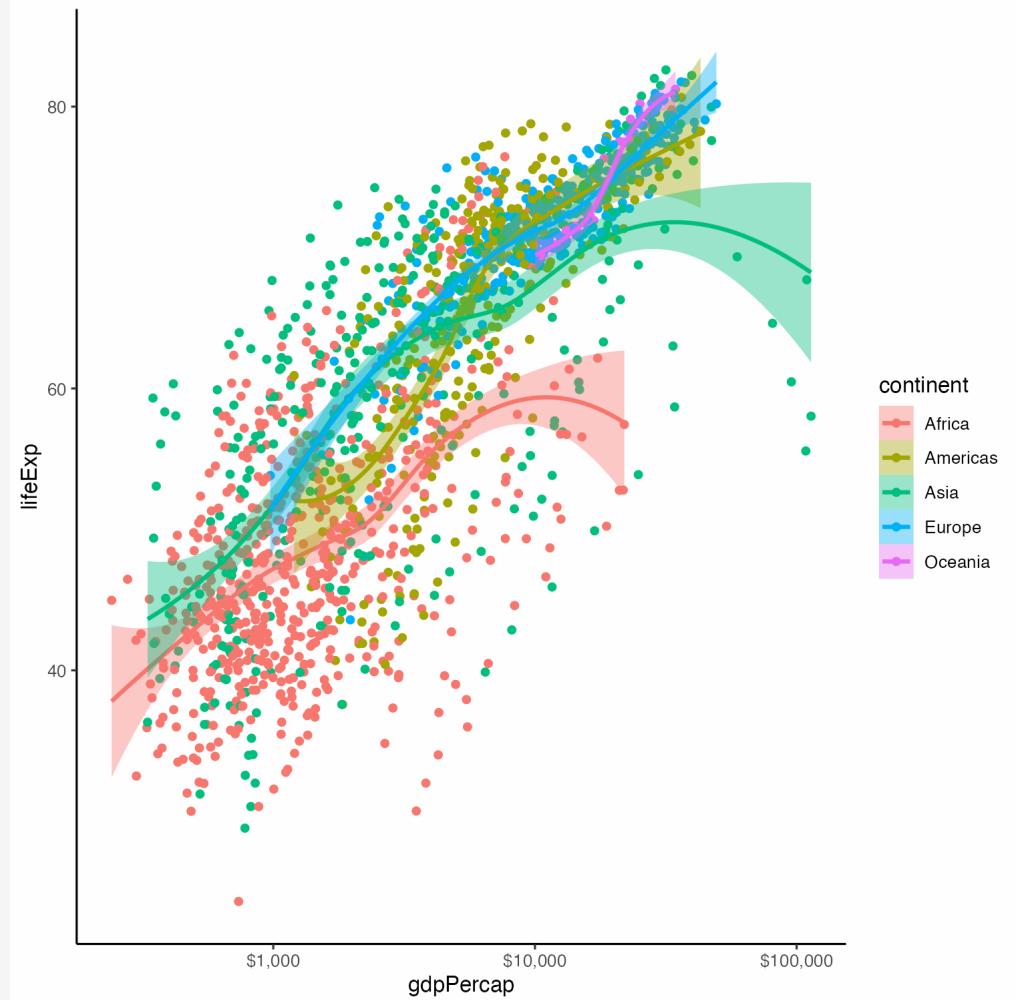

Geoms can take their own mappings

```
p ← ggplot(data = gapminder,  
            mapping = aes(x = gdpPercap,  
                           y = lifeExp,  
                           color = continent,  
                           fill = continent))  
  
p + geom_point() +  
  geom_smooth(method = "loess")
```

Geoms can take their own mappings

```
p ← ggplot(data = gapminder,  
            mapping = aes(x = gdpPercap,  
                           y = lifeExp,  
                           color = continent,  
                           fill = continent))  
  
p + geom_point() +  
  geom_smooth(method = "loess") +  
  scale_x_log10(labels = scales::label_dollar())
```

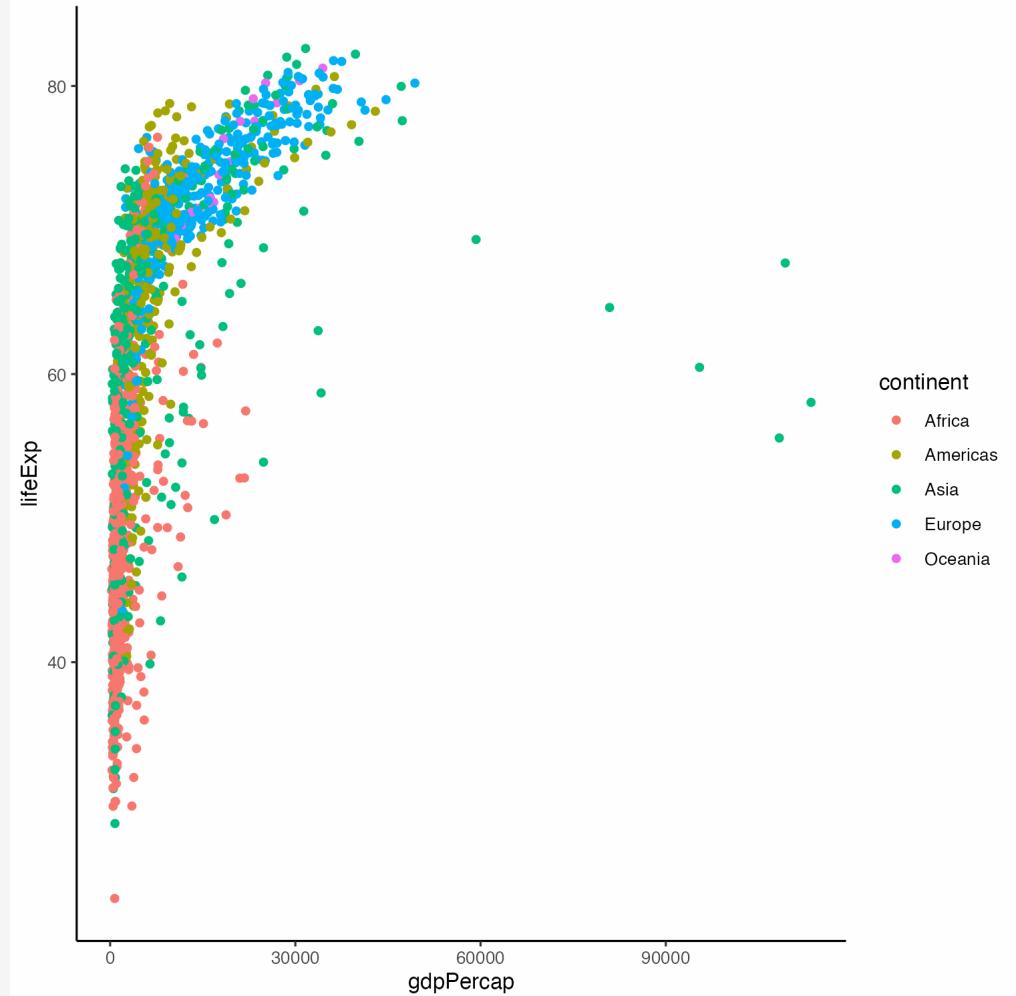

Geoms can take their own mappings

```
p ← ggplot(data = gapminder,  
            mapping = aes(x = gdpPercap,  
                           y = lifeExp))
```

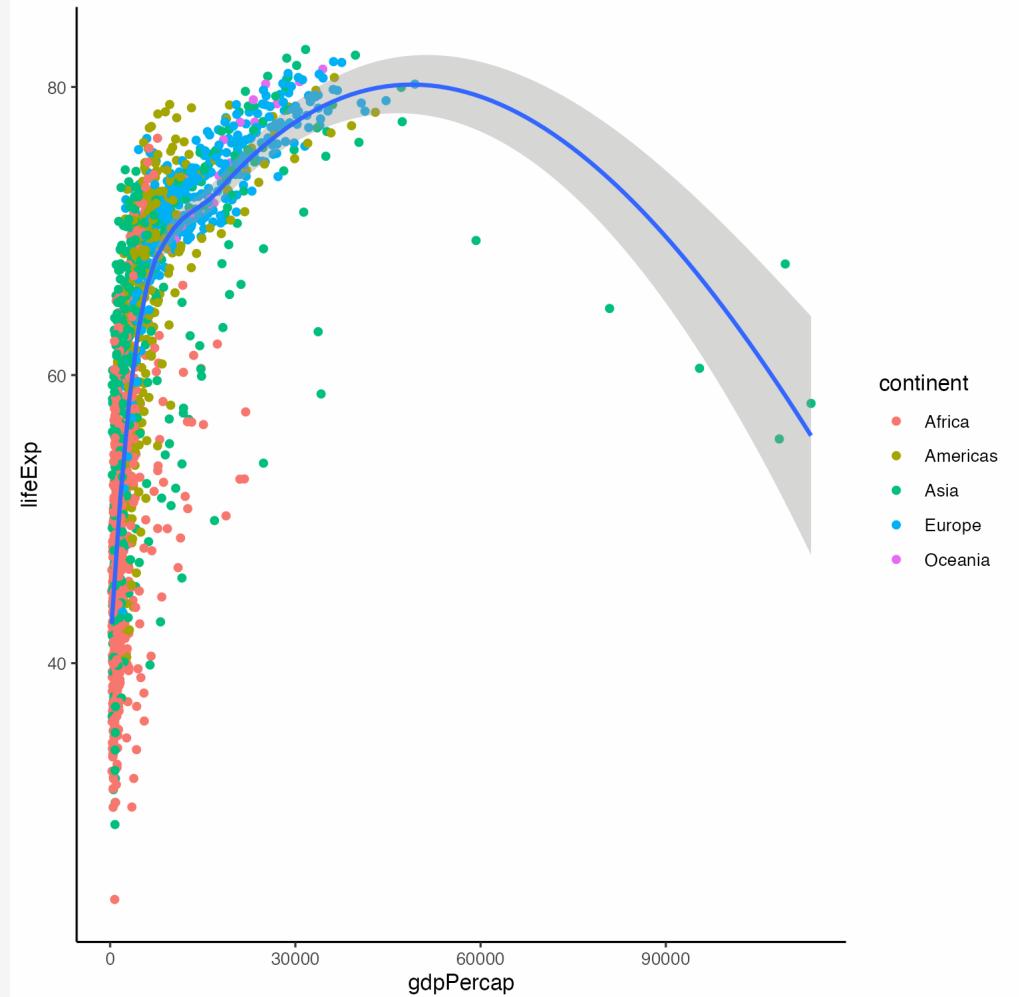

Geoms can take their own mappings

```
p ← ggplot(data = gapminder,  
            mapping = aes(x = gdpPercap,  
                           y = lifeExp))  
p + geom_point(mapping = aes(color = continent))
```

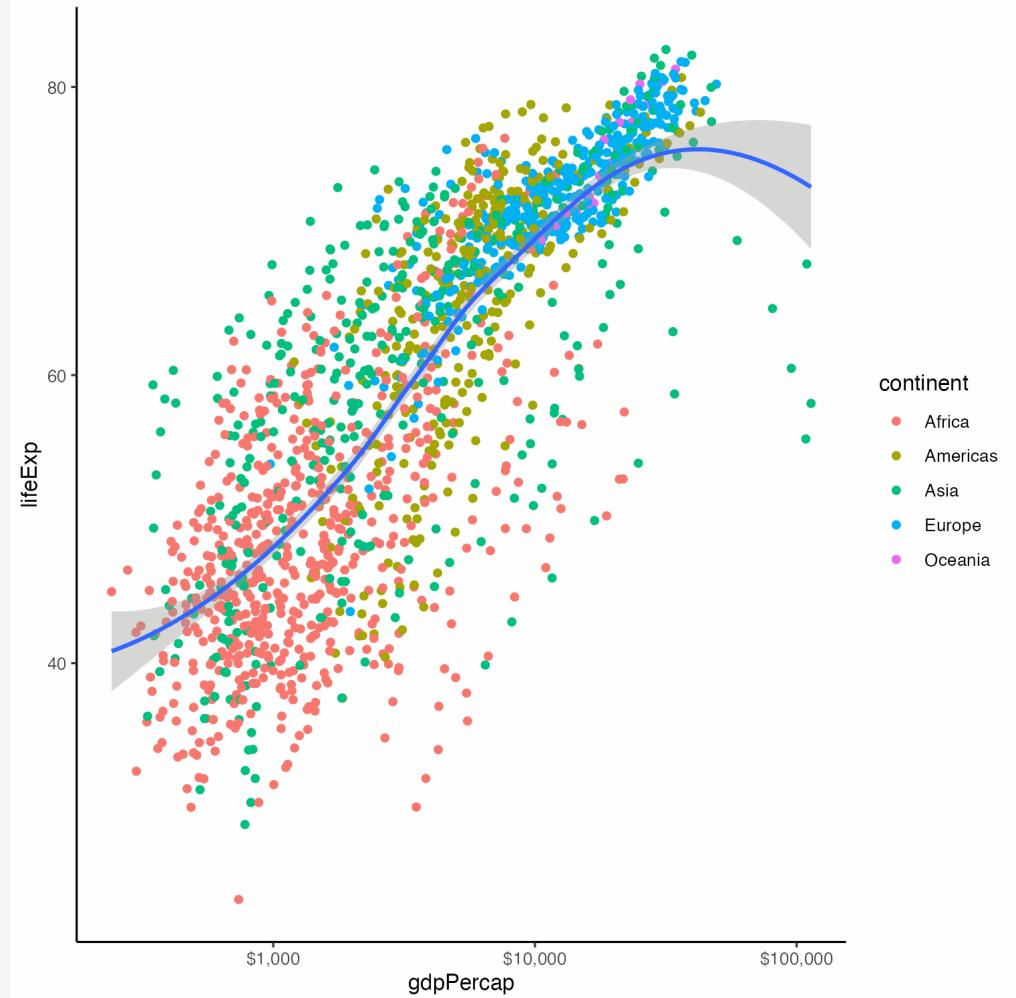

Geoms can take their own mappings

```
p <- ggplot(data = gapminder,  
             mapping = aes(x = gdpPercap,  
                            y = lifeExp))  
p + geom_point(mapping = aes(color = continent)) +  
  geom_smooth(method = "loess")
```

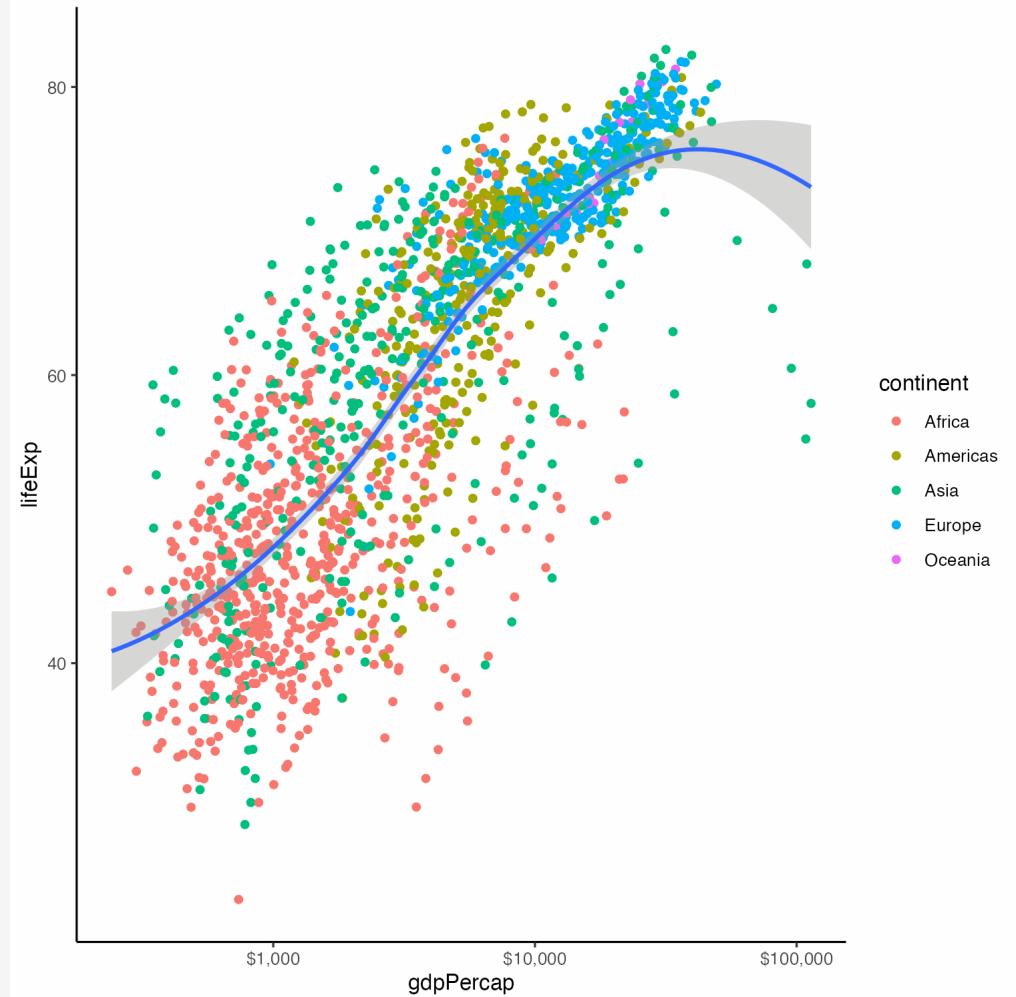

Geoms can take their own mappings

```
p ← ggplot(data = gapminder,  
            mapping = aes(x = gdpPercap,  
                           y = lifeExp))  
p + geom_point(mapping = aes(color = continent)) +  
  geom_smooth(method = "loess") +  
  scale_x_log10(labels = scales::label_dollar())
```

Geoms can take their own mappings

```
p ← ggplot(data = gapminder,  
            mapping = aes(x = gdpPercap,  
                           y = lifeExp))  
p + geom_point(mapping = aes(color = continent)) +  
  geom_smooth(method = "loess") +  
  scale_x_log10(labels = scales::label_dollar())
```

**Pay attention to
which scales and
guides are
drawn, and why**

Guides and scales reflect `aes()` mappings

```
mapping = aes(color =  
continent, fill = continent)
```

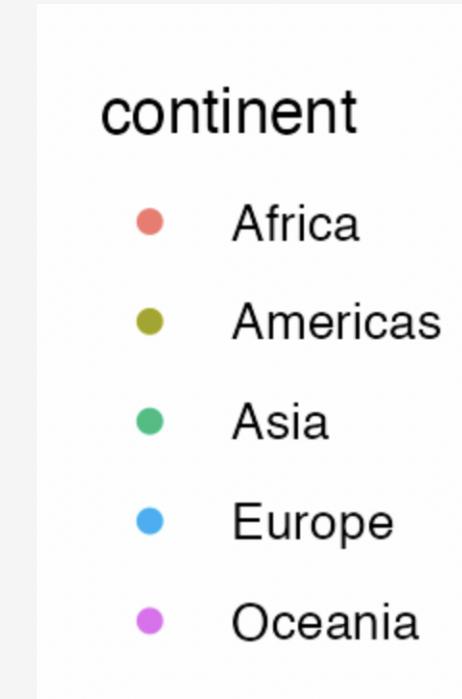

Guides and scales reflect `aes()` mappings

```
mapping = aes(color =  
continent, fill = continent)
```

```
mapping = aes(color =  
continent)
```

Remember:
**Every mapped
variable has a
scale**

Saving your work

Use ggsave()

```
## Save the most recent plot
ggsave(filename = "figures/my_figure.png")

## Use here() for more robust file paths
ggsave(filename = here("figures", "my_figure.png"))

## A plot object
p_out ← p + geom_point(mapping = aes(color = log(pop))) +
  scale_x_log10()

ggsave(filename = here("figures", "lifexp_vs_gdp_gradient.pdf"),
       plot = p_out)

ggsave(here("figures", "lifexp_vs_gdp_gradient.png"),
       plot = p_out,
       width = 8,
       height = 5)
```

In code chunks

Set options in any chunk header:

```
{r, fig.height=8, fig.width=5, fig.show = "hold", fig.cap="A caption"}
```

Or for the whole document:

```
knitr::opts_chunk$set(warning = TRUE,  
                      message = TRUE,  
                      fig.retina = 3,  
                      fig.align = "center",  
                      fig.asp = 0.7,  
                      dev = c("png", "pdf"))
```

Getting Help

The name of the function, and the library it is in.

What it does.

More details on each named argument. This will tell you what class of thing each argument has to be—an object, a number, a data frame, a logical value, etc.

What the function returns—i.e., the result of whatever operation or calculation it performs. This can be a single number, as here, or a multi-part object such as a list, a data frame, a plot, or a model.

R Documentation
Arithmetic Mean

Description

Generic function for the (trimmed) arithmetic mean.

Usage

```
mean(x, ...)
```

Default S3 method:
mean(x, trim = 0, na.rm = FALSE, ...)

Arguments

- x An R object. Currently there are methods for numeric/logical vectors and [date](#), [date-time](#) and [time interval](#) objects. Complex vectors are allowed for `trim = 0`, only.
- trim the fraction (0 to 0.5) of observations to be trimmed from each end of `x` before the mean is computed. Values of `trim` outside that range are taken as the nearest endpoint.
- na.rm a logical value indicating whether `NA` values should be stripped before the computation proceeds.
- ... further arguments passed to or from other methods.

Value

If `trim` is zero (the default), the arithmetic mean of the values in `x` is computed, as a numeric or complex vector of length one. If `x` is not logical (coerced to numeric), numeric (including integer) or complex, `NA_real_` is returned, with a warning. If `trim` is non-zero, a symmetrically trimmed mean is computed with a fraction of `trim` observations deleted from each end before the mean is computed.
